SUMMARY

Versatile Data Professional with experience across analytics, engineering, and modeling workflows. Proven track record building ETL pipelines, enabling data-driven decisions, and optimizing large-scale data processing in financial and operational settings. Proficient in SQL, Python, Power BI, and cloud-based data pipelines. Strong communication skills and business acumen with a bias for automation and impact.

SKILLS

Languages/Tools: SQL, Python (Pandas, Scikit-learn), PySpark, Power BI, Tableau, Excel
Data Engineering: ETL Pipelines, Airflow, Kafka, Pub/Sub, BigQuery, MS SQL Server
Analytics: KPI Trend Analysis, Forecasting, Classification, Regression, Anomaly Detection
Cloud/Data Lakes: Google Cloud (GCP), Snowflake (basic), Control-M (familiar)
Soft Skills: Cross-Team Collaboration, Problem Solving, Attention to Detail, Business Insight

EXPERIENCE

Data Engineer | XPAND IT Solutions, Inc Oct 2024 - present

- Built automated ETL pipelines using PySpark and Airflow to process 10M+ records daily, reducing data latency by 45%.
- Developed SQL procedures and optimized reporting on KPIs such as revenue, accounts receivable, and payment delinquency.
- Integrated Kafka and GCP Pub/Sub for real-time data streaming and alerting workflows.
- Partnered with analytics teams to engineer structured datasets supporting credit risk modeling and forecasting use cases.
- Created Power BI dashboards to monitor client-level financial behavior, reducing manual effort by 40%.

EDUCATION

New Jersey Institute of Technology - **MSc in Data Science** Sept 2022 - May 2024
Relevant Coursework: Statistical Modeling, Machine Learning, Big Data Analytics, Financial Modeling
Jawaharlal Nehru Technological University - **Btech in Information Technology** Aug 2017 - July 2021

PROJECTS

Fraud Detection System for Online Transactions

- Designed a real-time fraud detection system, processing millions of transactions using SQL and Pandas.
- Built a logistic regression model and anomaly detection algorithm with Scikit-Learn and TensorFlow.
- Deployed on AWS Lambda and S3, enabling scalable and efficient fraud detection.
- Improved detection accuracy by 30%, reducing financial losses and enhancing security.

Real-Time Sentiment Analysis

- The organization needed a robust pipeline to process and analyze real-time social media sentiment for customer feedback.
- Developed a real-time data pipeline integrated with Logistic Regression for binary sentiment classification. Utilized Apache
- Kafka for data streaming and TF-IDF for feature extraction. Implemented regularization to improve model generalization.
- Achieved 86% classification accuracy with a precision score of 0.84, while processing over 1,200 messages per second, enhancing the team's ability to respond promptly to customer sentiments.

Inventory Demand Forecasting

- Built a forecasting system to optimize inventory levels and reduce stockouts. Collected historical sales data and engineered time-series features like seasonality and trends.
- Implemented an ARIMA model with external regressors, such as promotional campaigns and holidays. Validated the model using Mean Absolute Percentage Error (MAPE) for forecasting accuracy.
- Reduced inventory holding costs by 15% and improved stock availability by 25%, ensuring better customer satisfaction.
