

Ashita Jagasia

231 Park Drive, #17, Boston, MA 02215 857.869.2385 ashitajagasia@gmail.com

<https://www.linkedin.com/in/ashita-jagasia-01a38014a/>

Education

Northeastern University, Boston, MA

Anticipated May 2019

Master of Science in Computer Systems and Networking

Relevant Courses: Data Networking, Linux for Network Engineers, Concepts of Object Oriented Design, Software Defined Networking

Mumbai University, Mumbai, MH, India

May 2017

Bachelor of Engineering in Electronics Engineering

Relevant Courses: Microcontroller & Microprocessors, Fundamentals of Computer Networks, Computer Architecture, Object Oriented Design using Java, Circuit Theory, Digital Circuit Design

Technical Skills

Programming skills:

Python, Java, HTML, Bash scripting

Tools:

Cisco packet tracer, Mini-net, Wireshark, Microsoft Office

Testing Tools:

Selenium, Jira, Apache Maven

Virtualization Platforms:

VMware ESXI, VirtualBox

Operating systems:

Linux (Ubuntu, Red Hat), Windows Server,

Networking Protocols:

OSPF, NAT, TCP/IP, HTTP, DHCP, DNS, VLAN, STP, SIP, OpenFlow

Certifications:

CCNA Routing & Switching(Pursuing), AWS (Pursuing)

Academic Projects

SDN Load Balancer

April 2018

- Designed a network which distributed the load among the servers. The servers were configured as simple **HTTP** server.
- The network consisted of pox controller, **OpenFlow** switch which was configured as load balancer, and hosts.

SDN based Network Traffic Management

March 2018

- Designed a network infrastructure consisting of two departments where every department has its own subnet. The infrastructure was a part of a single office environment.
- To provide the data access, HTTP server was created and to grant access permissions ACL was implemented. The design was implemented using **Mininet**, network emulator based on the OpenFlow standard.

Client-Sever python application using public key cryptography

Feb 2018

- Designed a **client-server** model using python which was built on Ubuntu operating system and used public key cryptography for accomplishing authentication and encryption.
- Generated the private and public keys using **RSA** encryption which is asymmetric cryptographic algorithm to secure the data transmission.

Linux Ad-hoc Network

Nov 2017

- Designed and configured a robust and dynamic network solution for a start-up company including the active and standby **DNS** server, **DHCP** server, Web server using shell scripting.
- Designed network security system, that blocked the unauthorized access to or from private network and also formulated backup server to get backup of files, data, applications on a remote server.

Enterprise Network using Cisco Packet Tracer

Oct 2017

- Designed a high-level network architecture to connect the headquarters and other subsidiary companies, configured DHCP servers to dynamically assign the IP addresses.
- Implemented and configured **VLANs** for security and cost optimization purposes; implemented **HSRP** for backup protection and load balancing for headquarters, also employed **OSPF** as routing protocol, and Frame Relay to connect all the companies in the backbone area, configured other functions such as MAC flooding, ACL, password encryption, redundancy switches to optimize the network design.

Experience

Bhabha Atomic Research Center, Mumbai, MH, India

June 2014-July 2014

Intern/ Research Student

- Led detail-oriented study on components which are incapable of controlling the current or voltages by means of another electrical signal, also analyzed the applications of semiconductors.
- Computed delineation of the printed circuit boards and examined the layout specification of the design. Assisted and critiqued maintenance of reactor process equipment and formulated optimization of thermal hydraulic design
