

AADITYA SHUKLA

272 Hamilton Street, APT C-20, New Brunswick, New Jersey 08901.

732-895-8558 | aaditya.shukla@rutgers.edu

EDUCATION

Rutgers University	New Brunswick, NJ
Masters, Computer Engineering GPA: 3.83	Present
Visvesvaraya Technological University, Bangalore	Bangalore, India
B.E., Electrical & Computer Engineering GPA: 71.33	June 2013

WORK EXPERIENCE

Accenture plc	Bangalore, India
Software Engineer	September 2013 - July 2015

Worked on Openlink Endur in CTRM domain (Commodity trading and Risk management). Managed End of the day activities in production environment. Developed code in Java as per business requirements and created runbooks as a part of knowledge transition within the team members. Responded to client's queries and consolidated root cause analysis report. Overall contribution in the project was evaluated and rated as significantly above peer group which is given to **top 5-10%** of the total members within the same peer group.

- Brainstormed and then Programmed/Developed the solution to common production related issues knowing the system architecture.
- Improved the performance of workflows using grid implementation and parallel processing architecture, the workflow runtime was slashed by two hours.
- Presented business technology solutions to Client with estimated development time and then Developed, Tested, and Integrated the solutions with L3 support team.
- Recommended various process to be automated which required user effort and then designed its technical document.
- Developed SQL queries to fetch the data from database and then developed scripts to generate reports. □ Responded to client's queries and coordinated between various team in case of major production related issues. Most of the time other team was a different organization who worked for client in similar domain.
- Performed various types of functional testing on Endur Gas and Power application such as Disaster recovery, Health checks, etc.
- Experienced in setting up the Endur Environment for Development, Acceptance and System Integration testing.

RESEARCH EXPERIENCE

-
- Cloud Computing (Member of Paramathics group at Rutgers University)
Paramathics work towards various aspect of cloud computing and developing high performance libraries. Currently we are working towards improving fault tolerance in iterative methods which

are used for solving sparse linear system, such as conjugate gradient. Our contribution with respect to existing Algorithm-Based Fault Tolerance (ABFT) is to present a methodology for fault tolerance on solving sparse linear system, including error detection, location and recovery in linear algebra operation.

ACADEMIC PROJECT

- **Traffic Monitoring System**
Designed a website and android app which displays the predicted traffic based on the historical values. Also users can view special events, construction sites and incidents.
- **Stock and Bank account management system**
Designed and implemented a system which manages Stock Portfolio Account and Bank Account. This system was implemented using self-programmed data structures.
- **Analysis of K-Means clustering algorithm in a standard movie recommendation system**
Implemented and analyzed the behavior of the standard K-Means clustering algorithm and alternatives to it: K-Harmonic means algorithm and K-means++. The aim was to find which aspects of these algorithms contribute in finding good clustering, as opposed to converging to a low-quality local optimum. The dataset which was used to test these algorithm was six thousand distinct movies and more than one million user ratings.
- **Web based stock forecasting**
Designed a website which has various graphical representation of stock patterns and also forecasting method which is based on Bayesian curve fitting algorithm, artificial neural networks and SVM. This system was tested on thousands of live traded stocks; the data was collected from Yahoo Finance API.
- **Detection of malware in android phone using Permission Analyzer during run time and Real time monitoring of SMS in android phones.**
Programmed Naïve Bayes classifier in android app to detect malware based on the permissions and implemented Sensitive API monitoring system which monitors system level calls such as SMS API, etc., on android device. It generates a report which can be used by a Malware analyst for dynamic analysis of an executable.

TECHNICAL SKILLS

- C, C++, Java, HTML/CSS, SQL, JVS/AVS, Android development, Rest API, JSON, JavaScript, Bash, Web development, Android development.
Assembly Language: Microcontroller 8051.

CERTIFICATIONS

National Stock Exchange (India) - Financial Market (Part 1)
