

Kadari Akhila Health Care Data Analyst

akhila@myworkmails.com | (313) 485-1252 | Michigan | [LinkedIn](#)

Summary

Detail-oriented and results-driven Healthcare Data Analyst with 3+ years of expertise in analyzing complex healthcare data to derive actionable insights. Proficient in data cleaning, transformation, and visualization using tools such as Python, SQL, Power BI, and Tableau. Adept at identifying trends, optimizing healthcare processes, and supporting strategic decision-making. Strong background in statistical analysis, predictive modeling, and improving operational efficiency within healthcare organizations. Excellent collaborator with cross-functional teams and a focus on delivering high-quality, data-driven solutions to enhance healthcare outcomes and resource allocation.

Technical Skills

- Programming & Analysis Tools: Python (Pandas, NumPy, SciPy), SQL, DAX
- Data Visualization & BI Tools: Power BI, Tableau, Level of Detail (LOD) expressions
- Statistical Analysis: Logistic Regression, Correlation Analysis, Time Series Analysis
- Data Integration & Transformation: SQL, Python (Data Cleaning & Transformation)
- Data Modeling & Forecasting: Demographic Modeling, Predictive Analytics
- Other Tools: PopAnalyzer, EHR Data Integration, Healthcare Standards Compliance

Professional Experience

Healthcare Data Analyst, Definitive Healthcare	10/2023 – Present Remote, USA
• Worked on Healthcare Utilization Trend Analysis project, studying patterns of healthcare utilization across various demographics, regions, and timeframes. Collaborated with stakeholders through requirement gathering sessions and worked closely with cross-functional teams for data collection and insights. • Analyzed over 750k healthcare utilization records, examining ER visits, outpatient care, and surgeries, identifying significant trends based on age, geography, and insurance coverage, leading to a 20% improvement in demand prediction accuracy. • Utilized Python (Pandas, NumPy) to perform time series analysis and demographic modeling, uncovering key insights into utilization patterns, which contributed to a 25% reduction in resource allocation inefficiencies for healthcare providers. • Developed interactive dashboards using Power BI and DAX to visualize complex healthcare utilization trends, reducing reporting time by 35%, enabling stakeholders to make data-driven decisions for optimizing resources and operational efficiency. • Collaborated with the data engineering team to integrate and clean data from over million patient records across multiple healthcare systems using Python and SQL, ensuring 99% data integrity and quality for accurate analysis and reporting. • Presented key findings and actionable insights to senior leadership, enhancing healthcare resource planning and improving patient access by 22%, based on demographic and regional healthcare usage trends, guiding strategic policy decisions and initiatives.	
Healthcare Analyst, Health Catalyst	01/2021 – 07/2022 India
• Initiated the Predictive Analytics for Hospital Readmissions project by gathering requirements from stakeholders and integrating EHR, demographic, and admission data using SQL and Python for data cleaning and transformation into actionable datasets. • Collaborated with clinical, IT, and data governance teams to define patient cohorts using PopAnalyzer and Python scripts for cohort segmentation based on diagnosis codes, comorbidities, and discharge types relevant to readmission risk. • Applied Python libraries such as Pandas, Numpy and SciPy for statistical analysis, including logistic regression and correlation analysis, to identify significant readmission predictors and generate actionable insights for clinical teams. • Worked with care coordination and quality improvement teams to validate insights and ensure that findings aligned with clinical workflows, using Python to automate data validation checks and ensure compliance with healthcare standards. • Developed dynamic Tableau dashboards using Level of Detail (LOD) expressions and Python to automate data extraction and visualization, enabling real-time monitoring of readmission risk scores and trends for decision-making by leadership. • Conducted trend analysis and root cause analysis using Python-based scripts to uncover inefficiencies in discharge planning, patient follow-up, and social determinants that contributed to higher readmission rates. • Delivered key outcomes, including a 17% reduction in 30-day readmissions, by using Python to optimize data processes and implementing targeted interventions that improved discharge planning and post-discharge care management.	

Education

University of Michigan – Dearborn, MI, USA	
Master of Science in Health Information Technology	08/2022 – 04/2024
SVS Institute of Dental Sciences, Mahbubnagar, India	
Bachelor of Dental Surgery (BDS)	10/2016 – 01/2022
