Technical Skills

Front End: Java, JavaScript, TypeScript, React, HTML, CSS

Back End: Axios, Node.js, Express, MySQL, PostgreSQL, Spring Boot, RESTful API

Testing/Deployment: Jest, Mocha, Chai, JUnit, Spring Security, JWT, AWS

Developer Tools: Vim, Git, npm, Webpack, Babel, Docker, Maven, Agile Methodology, Scrum, Ticket tracking boards

Relevant Projects

Full Stack Engineer and Security lead: Fleet Manager: <https://github.com/kieff18/fleet-manager> 2025

This app was a team project built to assist a delivery company in managing their trucks and routes

- Extended Spring Security's User class to make a more complex user that could be authenticated
- Restricted access to our API endpoints to only users with the role of Driver or Manager
- Collaborated with two other engineers to figure out which roles needed access to information
- Added Authorization headers to all front end API calls to pass the JWT to the AuthController

Full Stack Engineer and Project Manager: Virtual Relay: <https://github.com/rocknswimmer/Relay-MVP> 2024

This app started as a minimum viable product that served as the backbone of the final app I used for the relay

- Improved experience for runners, enabling them to mark legs complete with React on the front end and have a better viewing experience than through a spreadsheet by keeping the design mobile-focused
- Utilized the runners' updates to my API to unlock photos from the past every 25% of the relay
- Created a promise chain to generate and store all of the time estimates for the legs given a relay start time

Full Stack Engineer: github.com/rocknswimmer/HR-FOX-SDC-ANDY | <https://github.com/fecgrejoy/FEC> 2022

These apps are for a mock retail store page and its backend, I was responsible for the Q&A microservice

- Compressed the files to gzip for optimization of the first paint, reducing the size of the initial download
- Indexed commonly used PostgreSQL columns to reduce latency from 4s to 40ms on the local machine
- Conducted and analyzed Loader.io tests on the deployed EC2 instance, and concluded a load balancer would be needed to exceed 1000 requests per second while keeping latency under 50ms
- Deployed 3 additional EC2 instances, one of which used NGINX to load balance with a cache resulting in an average of 2ms latency at 2000 rps

Professional Experience

Independent Contractor: UberEats and Doordash June 2018 - present

- Analyze my market to know where and when I need to be to maximize daily earnings
- Performed over 5,000 deliveries and earned accolades like top dasher multiple times

Stock Lead: American Eagle Outfitters October 2013 – May 2018

- Managed a team of 5-7 associates, maximizing efficiency through standardized onboarding and training
- Effectively managed product storage, demonstrating resourcefulness in handling overflow situations

Education

Virginia Tech- BS, Mathematics: Relevant Coursework: C++, Python and Jython, Java May 2013

HackReactor: Advanced Software Engineering Immersive Program 2022

HTD: Full Stack Java Development 2025
