## SUMMARY

Data Analyst with over 4 years of experience turning complex data into actionable insights using Python, R, SQL, and cloud platforms (AWS, Azure). Skilled in statistical analysis, A/B testing, ETL, and building interactive dashboards with Tableau, Power BI, and Looker. Proficient in data wrangling, governance, and collaborating cross-functionally to deliver data-driven business decisions.

## EDUCATION

### Master of Science in Information Studies

Trine University

May 2025

Detroit, MI

### Bachelor of Technology in Computer Science Engineering

KNRR College

2021

Hyderabad, India

## SKILLS

**Languages:** Python, SQL, NoSQL, R Programming

**IDEs:** Visual Studio Code, PyCharm

**Package & Tools:** NumPy, Pandas, Matplotlib, Seaborn, Scikit-learn, TensorFlow, Keras, XGBoost, PyTorch

**Business Intelligence Tools:** Tableau, Power BI, Advanced Excel, Looker, Power Query

**Databases and Tools:** SQL Server, MySQL, MongoDB, Knack, SQL Server Management Studio (SSMS), Teradata

**Cloud:** AWS (S3, EC2, Redshift, Quick Sight, DynamoDB), Azure

**Data Governance & Compliance:** Data security, regulatory adherence (GDPR, CCPA)

**Data Wrangling & Management:** Data Cleaning, Data Transformation, Data Integration, Data Warehousing, Data Governance

**Statistical Techniques:** Hypothesis Testing, Data Visualization, A/B Testing, Model Evaluation

## EXPERIENCE

### WordPerfect Corporation, USA

Aug 2024 – Current

#### Data Analyst

- Developed interactive Tableau dashboards and executive KPI scorecards to monitor user license subscriptions and customer lifetime value, improving visibility for product, sales, and customer success teams and increasing analytics adoption by 25% across business units.
- Implemented data validation frameworks to ensure accuracy of customer and transaction records across CRM, billing, and licensing systems, reducing data integrity issues by 20% and supporting compliance with SOX and internal IT audit controls.
- Performed exploratory data analysis (EDA) and preprocessing on 5M+ rows of customer activity, license usage, and support ticket logs using Python and SSMS, identifying outliers and null patterns that improved data reliability for churn prediction and upsell modeling.
- Integrated customer, product, and transaction data from legacy systems into a centralized reporting warehouse, automating ETL pipelines and reconciliation logic, which boosted reporting accuracy and reduced manual validation time by 40%.
- Built dynamic Amazon QuickSight dashboards to track subscription health, billing compliance, and feature usage trends, providing real-time insights to regional account managers and growing dashboard usage by 60% within 3 months of deployment.
- Streamlined internal data workflows by scripting Python-based ETL jobs to ingest and transform inputs from diverse formats (CSV, SQL dumps) into standardized warehouse schemas, reducing batch processing time from 4 hours to under 30 minutes.
- Partnered with the data engineering team to optimize data warehouse architecture supporting product usage and support analytics, achieving a 35% improvement in complex query performance and enabling near real-time access for cross-functional stakeholders.

### KPIT, India

Apr 2020 – Jul 2023

#### Data Analyst

- Conducted customer segmentation analysis using Pandas, Matplotlib, and statistical methods for an automotive aftermarket solutions provider, identifying high-value customer cohorts that contributed to 35% of recurring service revenue, enabling personalized loyalty campaigns for spare parts and diagnostics services.
- Crafted Power BI dashboards integrated with Azure Synapse and SQL Data Warehouse to deliver supply chain visibility for an OEM client, improving insights into inventory turnover and vendor reliability, and reduce stockouts by 20% across regional distribution hubs.
- Designed A/B testing frameworks to evaluate engagement strategies in connected vehicle marketing campaigns for a mobility services client, increasing campaign click-through rates by 10% via data-driven personalization of app notifications and email outreach.
- Automated ETL pipelines using Python (NumPy, Pandas) to clean and transform CRM and warranty claims data for a Tier-1 automotive client, reducing monthly data preparation time from 3 days to under 4 hours, supporting faster insights for after-sales support teams.
- Collaborated on enterprise data governance programs for a global automotive parts manufacturer, aligning reporting structures and metrics across functions, which reduced reporting inconsistencies by 30% across plant operations, procurement, and logistics.
- Performed multivariate analysis and hypothesis testing on customer retention and service engagement data for vehicle owners, identifying statistically significant behaviors that drove repeat visits, informing product bundling strategies that increased repeat revenue by 12%.
- Developed Looker dashboards to track cost per lead (CPL), service visit lifetime value, and Net Promoter Score (NPS) for a connected services program, delivering insights that influenced strategic decisions on dealer engagement and subscription pricing.
- Assessed predictive model performance (classification and regression) used in vehicle health prediction and service appointment forecasting, using ROC-AUC and residual diagnostics to ensure models met OEM-mandated accuracy and compliance thresholds.
