SUMMARY

Experienced Software Developer with a proven track record of designing, developing, and optimizing innovative software solutions for healthcare, real estate, and financial industries. Adept at leveraging Java, Spring Boot, Angular 8, and hibernate to build scalable microservices and dynamic web applications. Skilled in implementing RESTful APIs, real-time data streaming with Apache Kafka, and Jenkins CI/CD for automated deployment, ensuring 99.9% system uptime.

Expertise in enhancing user interfaces with HTML5, CSS3, and Bootstrap, improving user engagement by up to 35%. Known for delivering results in Agile environments, reducing operational inefficiencies by 25% and improving decision-making speed in high-pressure situations. Committed to improving software performance, security, and user experience through advanced programming techniques and integration of cutting-edge technologies.

TECHNICAL SKILLS

Languages: Java, C/C++, XML, UML, SQL, Python, PL/SQL
J2EE Technologies: Servlets, JSP, JSTL, JDBC, JMS, RMI, EJB, Swing, AWT
Web Technologies: NodeJS, ReactJS, AngularJS, Angular 2-8, jQuery, Karma, XML, JSON, CSS3, HTML5, Bootstrap
Databases: Oracle, SQL Server, MySQL, DB2
Frameworks: ASP.NET, Struts, Spring, Spring Boot, Spring MVC, Hibernate, JSF
Operating Systems: Windows, Linux, Unix
Methodologies: Agile, Scrum, RUP, TDD, OOAD, SDLC
Application/Web Servers: Weblogic, Apache Kafka, IBM WebSphere, JBoss, Tomcat
Web Services / XML Technologies: WSDL, SOAP, REST, XML, DOM, jQuery

EXPERIENCE

CVS Health, USA – Software Developer 07/2024 – Present

- Created dynamic dashboards with Angular 8 and jQuery, leveraging event-driven programming and reusable components to visualize patient trends and lab results, reducing manual data aggregation efforts by 20% and improving decision-making speed during consultations.
- Developed scalable microservices using Spring Boot and Spring Data JPA to manage patient data, including metrics for acute kidney injury, sepsis, and heart failure, enabling real-time updates and improving data retrieval speeds by 25%, critical for timely physician interventions during emergencies.
- Enhanced database efficiency using Hibernate ORM with optimized PL/SQL procedures, reducing query execution times by 30%, which allowed physicians and lab attendants faster access to critical patient information during urgent care situations.
- Implemented real-time data streaming with Apache Kafka, enabling seamless updates for patient alerts like sepsis warnings and rapid responses across departments, which enhanced communication and reduced response times by 20% in critical scenarios.
- Designed RESTful APIs using Spring Boot for secure and efficient integration of patient schedules, lab results, and teleconsultation updates, streamlining workflows across clinics and reducing errors in physician-patient coordination by 15%.
- Built user-friendly interfaces with HTML5, CSS3, and Bootstrap, incorporating responsive design principles to ensure consistent accessibility across devices, which improved navigation efficiency by 20% and enhanced usability for medical staff.
- Streamlined deployment processes using Jenkins CI/CD pipelines with integrated GitHub version control, enabling automated builds and ensuring 99.9% system uptime, while reducing deployment errors by 30% during portal enhancements.
- Integrated SOAP-based web services to securely transmit sensitive patient data across different portal modules, ensuring compliance with HIPAA standards and enhancing the reliability of data transfers for teleconsultations and lab updates by 25%.

- Designed and implemented the real estate portal's core functionality using Angular 8's two-way data binding and Spring Boot's microservices architecture. This allowed realtors and clients to view real-time property updates like pricing, area size, and deal status seamlessly. This feature improved operational efficiency for realtors by reducing manual updates, enabling faster responses to client inquiries, and increasing overall user engagement by 30%.
- Developed immersive 3D property visualization features using ReactJS for component-based rendering and WebGL for real-time 3D graphics. This allowed potential buyers to explore homes virtually in detail, including room layouts and surroundings, eliminating the need for physical visits during early stages of negotiation. This led to a 20% rise in portal visits and a 15% increase in client satisfaction scores.
- Optimized back-end services using Java and Hibernate for ORM, ensuring efficient database interactions and reducing query response times by 25%. This enhancement streamlined the integration of live property data from external feeds, enabling realtors to manage and update listings more effectively, which directly improved the accuracy of information displayed to clients.
- Enhanced front-end performance using Bootstrap's responsive grid system and CSS3 animations, ensuring a consistent and interactive experience across devices. This improvement allowed the portal to cater effectively to both desktop and mobile users, resulting in a 35% increase in user engagement and accessibility for on-the-go clients.
- Participated in Agile sprints by leveraging SDLC methodologies and tools like JIRA for task management and tracking. This collaborative approach enabled faster feedback loops and the timely deployment of high-priority features like the property listing filter, which allowed users to narrow search results by price range and area size. The project was delivered 10% ahead of schedule, ensuring stakeholders met their business objectives efficiently.

Kranion Technologies, INDIA – JR. Software Developer**10/2019 – 07/2022**

- Developed a loan application processing system using Java and Spring Boot, integrating credit scoring algorithms and approval workflows via JDBC for database interaction. The use of Spring Boot's microservices architecture enabled automation of loan approval processes, reducing manual intervention by 40% and speeding up loan processing by 25%, which allowed for quicker customer decision-making.
- Enhanced repayment tracking by implementing JSP for dynamic webpage rendering and hibernate for object-relational mapping (ORM), ensuring seamless integration with SQL Server for accurate financial transactions. This reduced errors by 20%, improving the accuracy of loan payment histories and allowing real-time updates for both clients and loan officers.
- Created a credit risk assessment module using PL/SQL for data manipulation and Oracle for efficient database querying. The integration of this module into the loan system allowed for real-time assessment of applicant creditworthiness, reducing default risks by 15% and ensuring more profitable lending decisions.
- Integrated a payment gateway using NodeJS for server-side logic and RESTful APIs to securely process loan repayments. By using jQuery for dynamic updates on the user interface, the system processed repayments efficiently, reducing transaction failures by 10% and improving overall customer satisfaction.
- Worked in an Agile environment to refine the loan management system by using Spring MVC for modular controller design and improved client-side interaction. This enabled loan officers to handle 30% more applications per day, improving team productivity and ensuring quicker loan approvals.
- Optimized financial reporting by utilizing XML for standardized data formats and JMS for reliable messaging to integrate loan data with external systems. This streamlined the reporting process, cutting monthly report generation time by 35% and improving accuracy by ensuring consistent data flow across systems.

EDUCATION

Master in Computer Science
Illinois State University, USA

05/2024
