

Professional Summary:

- Demonstrated ability to collaborate in Agile environments, track progress using JIRA/Rally, and deliver high-quality, maintainable, and secure software solutions aligned with business requirements.
- Experienced Full Stack Developer with around 5 years of hands-on experience in designing, developing, and deploying scalable enterprise applications, primarily in the healthcare domain.
- Proficient in building cloud-native microservices architectures using Java (17/11/8), Spring Boot and front-end frameworks including Angular (14/4) and React 15.
- Skilled in building and consuming APIs with OpenAPI, Swagger UI, and managing inter-service communication using RabbitMQ and Kafka.
- Strong expertise in backend development with Spring MVC, Spring Batch, JPA, Hibernate, RESTful APIs, and secure authentication mechanisms using OAuth2 and Spring Security.
- Well-versed in testing frameworks like JUnit, Mockito, Mocha, Cucumber, and Protractor, with focus on full CI/CD pipelines and maintaining code quality using SonarQube.
- Experienced in deploying microservices on AWS (EC2, Lambda, S3, RDS, CloudFormation, ELB) and Azure (AKS, Functions, Blob Storage, Cosmos DB, App Services, Event Hubs) with automation through Jenkins, Azure DevOps, and AWS CodeDeploy.
- Experienced with Git, SVN, Maven, Gradle, and IDEs like IntelliJ and VS Code.

Technical Skills:

Programming Languages: Java (17/11/8), JavaScript, SQL, HTML5, CSS3, C.

Frameworks: Spring Boot, Spring Security, Spring MVC, Spring JDBC, JPA, Hibernate, Bootstrap, Angular (14/4), React 15.

Methodologies: Agile.

Database: PostgreSQL, Oracle, SQL Server, Azure Cosmos DB, AWS DynamoDB.

Testing & Automation: JUnit, Mockito, Mocha, Jasmine, Protractor, Cucumber, Postman, Swagger UI.

Messaging & Streaming: Apache Kafka, RabbitMQ.

Code Quality & Monitoring: SonarQube, Log4j, Slf4j, VMware Log Insight.

Tools and Technologies: Docker, Kubernetes, JUnit, Postman, Swagger UI, Cucumber, Protractor.

Cloud Technologies: Amazon AWS (EC2, S3, Lambda, CloudFormation, DynamoDB, RDS, ELB, CloudWatch Logs), Microsoft Azure (App Services, Functions, Event Hubs, API Management, Blob Storage, Monitor, Virtual Machines, Kubernetes Service).

Build & Deploy Tools: Gradle, Maven, Jenkins, AWS CodeDeploy, Azure DevOps.

Version Control: Git, SVN.

Project Management: JIRA, Rally, TFS.

Professional Experience:

Full Stack Engineer - Blue Shield of California, San Jose, CA

Jul 2022 - Present

Responsibilities:

- Followed Agile SDLC methodologies, participating in sprint planning, daily stand-ups, and retrospectives to ensure the iterative delivery of high-quality features.
- Coordinated tasks and tracked progress using Rally, ensuring clear communication within the team and adherence to project timelines.
- Architected and implemented a microservices-based solution using Spring Boot and Service-Oriented Architecture, ensuring modularity, scalability, and flexibility of services across the platform.
- Developed and exposed RESTful web services for communication between microservices and external applications, ensuring seamless data exchange.
- Utilized Hibernate ORM for seamless integration with DynamoDB, reducing data access times and improving overall database performance.
- Managed data exchange in JSON format for lightweight and efficient inter-service communication.
- Integrated Spring Cloud Gateway for managing service routing, load balancing, and authentication, ensuring secure and efficient API traffic flow.
- Implemented OAuth2 authentication and authorization to secure microservices, enhancing the protection of sensitive user data and enabling role-based access control.
- Developed the frontend using Angular, HTML, CSS, JavaScript, and Bootstrap, delivering responsive and user-friendly interfaces for business-critical applications.

- Utilized AWS DynamoDB as the NoSQL database for fast, scalable, and low-latency data storage and retrieval, optimizing performance for high-traffic environments.
- Leveraged AWS RDS for relational data storage, providing scalability and automated backups for better data durability.
- Integrated RabbitMQ for messaging and communication between distributed services, ensuring reliable and asynchronous processing of tasks.
- Utilized Amazon Managed Streaming for Apache Kafka to implement real-time, event-driven communication between Spring Boot microservices, ensuring high-throughput and fault-tolerant data processing.
- Conducted unit testing for backend components using JUnit and Mockito, increasing test coverage and reducing defects in production code.
- Applied Jasmine for testing Angular based frontend components, ensuring a robust and bug-free user interface.
- Utilized Postman and Swagger UI for API testing and documentation, ensuring clear, well-documented APIs that could be easily consumed by internal and external developers.
- Deployed the application on AWS EC2 instances, ensuring high availability, auto-scaling, and fault tolerance for the platform's backend services.
- Utilized AWS S3 for storing and managing static resources such as images and backups, providing a highly durable and secure storage solution.
- Implemented AWS Lambda for serverless processing of certain microservices, improving efficiency by reducing infrastructure management overhead.
- Set up Jenkins CI/CD pipelines to automate the build, testing, and deployment processes, reducing manual intervention and accelerating time-to-market.
- Integrated AWS CodeDeploy with Jenkins to streamline the deployment of microservices across different environments, ensuring seamless, automated updates.
- Deployed and managed AWS Elastic Load Balancer to distribute incoming traffic across multiple EC2 instances, ensuring fault tolerance and high availability.
- Configured AWS CloudFormation to automate infrastructure provisioning, reducing manual setup efforts and ensuring consistent, repeatable deployments.
- Monitored and enforced code quality using SonarQube, identifying code smells and technical debt early in the development lifecycle.
- Implemented logging using Log4j and integrated it with AWS CloudWatch Logs for real-time monitoring, troubleshooting, and alerting of application issues.
- Managed version control using Git, ensuring proper collaboration and branch management among team members.
- Utilized Maven as the build tool for efficient project dependency management and building the microservices-based system.

Technologies used: Java 17, Spring Boot, Spring Cloud Gateway, Spring Security, Hibernate, OAuth2, REST, SOAP, Microservices, Angular 14, HTML5, CSS3, JavaScript, Bootstrap, Jasmine, AWS EC2, AWS S3, Apache Kafka, AWS RDS, AWS Lambda (Java 17 Runtime), AWS CloudWatch, AWS ELB, AWS CloudFormation, AWS CodeDeploy, DynamoDB, RabbitMQ, JUnit, Swagger UI, Postman, Jenkins, Maven, Git, Log4j, Rally, IntelliJ IDEA.

Software Engineer - JPMorgan Chase, Dallas, TX

Sep 2020 - Jul 2022

Responsibilities:

- Followed Agile SDLC methodologies, actively participating in sprint planning, daily stand-ups, and retrospectives to ensure timely and efficient project delivery.
- Coordinated tasks and tracked project progress using JIRA, ensuring clear communication, task assignment, and progress tracking in an Agile environment.
- Designed and implemented a microservices architecture using Spring Boot and Service-Oriented Architecture, ensuring the system was modular, scalable, and easily maintainable.
- Developed and exposed RESTful web services, enabling secure and efficient communication between distributed services and external systems.
- Leveraged JPA as the ORM framework to integrate SQL Server database, optimizing data access and persistence operations.
- Managed data exchange between services using JSON format, ensuring lightweight and fast communication across the microservices ecosystem.
- Configured and deployed Spring Cloud Gateway on Azure App Services for service routing, load balancing, and centralized authentication, improving system resilience and security.
- Implemented OAuth2 for secure authentication and authorization across microservices, enhancing the security of the system by managing user access tokens.

- Developed the frontend using ReactJS, HTML5, CSS3, JavaScript, and Bootstrap, delivering a responsive and dynamic user interface with high performance.
- Utilized Azure Kubernetes Service for container orchestration, deploying and managing Docker microservices, improving scalability and fault tolerance.
- Integrated Azure Cosmos DB to handle distributed, scalable database management, providing low-latency access to global data.
- Utilized Azure Functions (Java 11 Runtime) to implement serverless architecture for certain backend tasks, optimizing costs and reducing infrastructure overhead.
- Set up Azure API Management to manage, secure, and scale API usage across multiple microservices, ensuring smooth API consumption by internal and external users.
- Utilized JUnit and Mockito for unit testing and mocking within the backend, ensuring code quality and reliability with a high level of test coverage.
- Applied Mocha for testing the ReactJS frontend components, ensuring robustness and minimizing UI-related bugs during development.
- Used Cucumber for automated testing of web services, validating the functional behavior of APIs and ensuring alignment with business requirements.
- Employed Protractor for end-to-end testing, simulating real user scenarios to ensure complete functionality of the web application.
- Utilized Postman and Swagger UI for API testing and documentation, ensuring that APIs were well-documented and easy to integrate with external systems.
- Deployed the application to Azure Virtual Machines for hosting compute-intensive services and workloads, ensuring high availability and disaster recovery.
- Managed Azure Blob Storage to store and retrieve unstructured data such as images and documents for scalable, secure storage.
- Set up Jenkins CI/CD pipeline integrated with Azure DevOps to automate the build, test, and deployment process, streamlining development workflows and accelerating delivery.
- Monitored and enforced code quality using SonarQube, ensuring clean, maintainable code by identifying technical debt and code smells early in the development cycle.
- Employed Git as the version control tool, facilitating efficient collaboration, branch management, and code reviews across the development team.
- Set up alerting and dashboards with Azure Application Insights to monitor the health and performance of microservices, enabling real-time troubleshooting and diagnostics.
- Utilized Gradle as the build automation tool, simplifying dependency management and enabling smoother project builds and deployments.
- Implemented logging and monitoring using Azure Monitor and Slf4j, providing robust logging mechanisms for better monitoring and debugging of the application.

Technologies used: Java 11, Spring Boot, React 15, Microservices, REST, Spring Cloud Gateway, Spring Security, JPA, SQL Server, OAuth2, Docker, Azure Kubernetes Service, Azure App Services, Azure Functions (Java 11 Runtime), Azure Virtual Machines, Azure Blob Storage, Azure Cosmos DB, Azure API Management, Azure Event Hubs, HTML5, CSS3, JavaScript, Bootstrap, JUnit, Mocha, Cucumber, Protractor, Swagger UI, Postman, Jenkins, Azure DevOps, Gradle, SonarQube, Git, Slf4j, Azure Monitor, Azure Application Insights, JIRA, IntelliJ.

Software Intern - Mphasis Corporation, New York, NY

Jun 2019 - Aug 2019

Responsibilities:

- Followed Agile SDLC methodologies, participating in sprint planning, backlog grooming, and retrospectives to ensure the timely delivery of high-quality features.
- Tracked project tasks and progress using TFS, ensuring proper task management, bug tracking, and sprint planning in the Agile process.
- Worked closely with cross-functional teams to ensure smooth project delivery, maintaining clear communication with stakeholders and aligning development goals with business needs.
- Developed a monolithic architecture using Spring MVC and integrated Spring Batch for processing large volumes of claims data in scheduled batch jobs.
- Built and exposed RESTful web services for data retrieval and integration with external systems, providing efficient and scalable service communication.

- Utilized Spring JDBC as the ORM framework to interact with an Oracle database, optimizing data access and query performance for a high-traffic application.
- Developed the frontend using JSP, HTML5, CSS3, JavaScript, and Bootstrap to deliver a responsive and maintainable user interface within the Spring MVC-based monolithic application.
- Conducted unit testing for backend services using JUnit and Mockito, improving code quality and reducing the occurrence of defects in production.
- Integrated logging with VMware Log Insight, providing real-time monitoring and error tracking, enabling quick detection and resolution of issues in production.
- Employed Maven as the build tool, simplifying dependency management, project builds, and deployments.
- Managed source code versioning and collaboration using SVN, ensuring efficient tracking of changes and version control in a large team environment.

Technologies used: Java 8, Spring MVC, Spring Batch, Spring JDBC, Oracle, JSP, HTML5, CSS3, Bootstrap, REST, JUnit, SVN, Maven, IntelliJ.

Education:

Master of Science in Computer Science

Dec 2020

Villanova University, Villanova, PA

Bachelor of Technology in Computer Science

May 2018

CVR College of Engineering, Hyderabad, TG, India
