Summary

Full Stack Developer with 5 years of experience specializing in **Java**, **Spring Boot**, and **Angular** for building scalable enterprise and **microservices** applications. Skilled in **RESTful API design**, **Kafka-based event systems**, and **SQL / NoSQL** data management for reliable business workflows. Experienced in **AWS cloud deployments** using **ECS**, **Lambda**, and **EC2** with **Docker** and **CI/CD pipelines** for automation. Proficient in **Spring Security**, **OAuth2**, **JWT**, and **RBAC** for secure authentication across distributed systems. Strong focus on **Resilience4j**, **Circuit Breaker**, and **SonarQube** for fault tolerance and code quality. Hands-on with **JUnit**, **Mockito**, and **JMeter** for testing and performance validation. Effective in **Agile environments** with active collaboration, production monitoring, and troubleshooting using **Splunk**, **OpenTelemetry**, and **CloudWatch**.

Technical Tools

Backend Technologies: Java 21, Java 11, Java 8, Spring Boot, Spring MVC, Spring Security, Spring Profiles, Spring Actuator, RESTful APIs, Microservices, Kafka, Resilience4j, JPA, Hibernate

Frontend Technologies: Angular 18, Angular 14, Angular 10, TypeScript, JavaScript, RxJS, HTML5, CSS3, Bootstrap, Reactive Forms, Lazy Loading, Angular Interceptors, Material UI

Database Technologies: PostgreSQL, MySQL, Oracle, MongoDB, DynamoDB, SQL, NoSQL, Redis, Indexing, Query Optimization, Transactions, Partitioning

Cloud Technologies: AWS ECS, AWS Lambda, AWS EC2, AWS S3, AWS RDS, CloudWatch, AWS Parameter Store, IAM, CloudFormation,

DevOps Tools: Docker, Jenkins, GitHub Actions, CI/CD Pipelines, Infrastructure as Code, Kubernetes, Terraform, Cloud Deployment Scripts

Testing and Quality Tools: JUnit, Mockito, JMeter, SonarQube, Unit Testing, Integration Testing, Regression Testing

Monitoring and Observability: Splunk, OpenTelemetry, CloudWatch Metrics, Distributed Tracing, Log4j

Version Control Tools: Git, GitHub, Bitbucket, Branching Strategy, Merge Requests, Version Control

Architecture and Design Patterns: SOLID Principles, Domain Driven Design, Circuit Breaker Pattern, API Gateway, Event Driven Design, Dependency Injection

Security Technologies: OAuth2, JWT, RBAC, Spring Security Filters, Token Validation, Role-Based Access Control

Operating Systems and Utilities: Linux, Windows, Shell Scripting, Postman, Swagger, IntelliJ, Visual Studio Code, Jira, Confluence, Agile

Professional Experience

Morgan Stanley

May 2025 – Current / NJ, USA

Senior Full Stack Developer

Project: Order Insight Platform

An **enterprise order analytics system** was developed using **Spring Boot** and **Angular 18** to handle product invoicing and order routing in microservices architecture. The platform used **Kafka Streams** to process and aggregate transactional data for real-time performance tracking. Built backend REST APIs and Angular dashboards while tuning PostgreSQL queries to enhance speed and data accuracy.

Responsibilities:

- Developed backend modules using **Java 21** and **Spring Boot** to design **RESTful APIs** for order routing and product invoicing within a distributed **microservices architecture**.

- Built reactive **Angular 18** dashboards using **TypeScript** modules to display real-time analytics and optimize rendering performance through dynamic component updates.
- Configured **Spring Profiles** for multi-environment setups and extended **Spring Actuator** to expose uptime, heap metrics, and thread usage for runtime visibility.
- Developed and optimized **JPA** entities and repositories with Hibernate to streamline ORM mappings and reduce boilerplate in data access layers.
- Designed **Kafka** topics for asynchronous message flow and applied **schema validation** with partition management to support event-driven order workflows.
- Implemented **Resilience4j** circuit breaker and fallback logic to maintain service stability and handle downstream **microservice** latency.
- Modeled relational structures in **PostgreSQL** and created optimized indexes to reduce query latency for high-volume transactional **SQL** modules.
- Used **MongoDB** as **NoSQL** storage to handle product logs and transient events for high-frequency reporting microservices.
- Implemented **Redis** caching to minimize database reads and improve response times across high-traffic microservices.
- Implemented **ECS** service blueprints with load balancing, target groups, and rolling updates to achieve zero-downtime deployments.
- Built **Kafka Streams** applications to aggregate and transform transactional data in real time, enabling downstream analytics and performance monitoring dashboards.
- Added secure authentication in **Spring Security** using **OAuth2**, **JWT**, and custom filters for **RBAC** control in API gateways.
- Developed **AWS Lambda** triggers for **S3** events to automate file parsing and asynchronous validation workflows in backend processes.
- Improved database efficiency by leveraging Amazon **RDS** Performance Insights and **CloudWatch** to monitor query latency, eliminate blocking locks, and enhance SQL throughput.
- Deployed containerized builds through **Docker** and **AWS ECS**, maintaining configuration consistency with **AWS Parameter Store** during rolling updates.
- Wrote **JUnit** and **Mockito** test cases for validation logic to improve regression coverage and detect functional gaps before system integration.
- Integrated **Swagger UI** and **OpenAPI 3** specifications in Spring Boot microservices for API documentation and endpoint visualization.
- Integrated **SonarQube** with **Jenkins** in **CI/CD** pipelines for code quality and rule compliance validation across **Java** and **Angular** projects.
- Configured **OpenTelemetry** with **Splunk** dashboards for **distributed tracing** to identify inter-service latency and communication delays.
- Tuned long-running **SQL** queries by rewriting joins and using prepared statements to enhance dashboard rendering speed.
- Applied **feature flags** for controlled feature rollout and rollback within **Angular** modules for A/B testing in production environments.
- Developed **AWS EC2** scripts for blue-green **deployment** automation and monitored service uptime through **CloudWatch** dashboards.
- Used **Jira** reports and burndown charts to monitor sprint velocity and identify bottlenecks in microservice delivery pipelines.
- Collaborated with QA and DevOps teams during **Agile sprints** to prioritize production hotfixes and validate cross-environment releases.

Technological Environment:

Java 21, Spring Boot, Spring Profiles, Spring Actuator, Spring Security, JPA, Hibernate, OAuth2, JWT, RBAC, RESTful APIs, Microservices, Kafka, Kafka Streams, Resilience4j, PostgreSQL, MongoDB, SQL, NoSQL, Redis, Swagger, OpenAPI Angular 18, TypeScript, Docker, AWS ECS, AWS Lambda, EC2, S3, Parameter Store, RDS, CloudWatch, CI/CD, JUnit, Mockito, SonarQube, Splunk, OpenTelemetry, Feature Flags, Linux, Jira, Agile

Project: Equity Workflow Portal

An **equity management platform** was designed with **Spring Boot** and **Angular 14** to support financial transactions and automated billing processes. The solution applied **Kafka** for asynchronous data flow and **Redis** caching to maintain responsive portfolio operations. Created service logic, integrated DTO mappings, and built Angular modules to display equity summaries and improve user interaction.

Responsibilities:

- Refactored legacy modules into **modular Java 11** services with **Spring Boot** and DTO mapping to simplify business logic and promote reusable code structures.
- Built **RESTful APIs** with structured validation in **Spring Boot** and applied **API Gateway** routing for uniform inter-service communication.
- Designed **Angular 14** dashboards using **RxJS** observables and **lazy loading** to optimize runtime speed and resource usage in web clients.
- Developed **TypeScript** interceptors to handle token refresh and unified HTTP error responses across multiple client modules.
- Implemented **Kafka** producers and consumers with retry policies and custom offset tracking to maintain event consistency in distributed **microservices**.
- Implemented **OAuth2** authentication and token based authorization using Spring Security to secure REST APIs and enforce role-based access across distributed microservices.
- Configured relational models in **PostgreSQL** and created **partitioned tables** to enhance SQL query performance for billing and transaction workflows.
- Integrated **DynamoDB** as **NoSQL** caching for real-time session access and reduced dependency on persistent databases during traffic spikes.
- Utilized **Spring Data Redis** for distributed cache management, key expiration, and synchronization between backend services.
- Managed **AWS ECS** deployments using **CloudWatch** alarms for scaling thresholds and **IAM** configurations to maintain secure task execution.
- Wrote **JUnit** and **Mockito** test suites for service and repository validation to maintain reliability through automated build pipelines.
- Migrated **AngularJS** views into **Angular 14** components using **Material UI** libraries and enhanced UI consistency with modular CSS grids.
- Implemented **Swagger** annotations across REST controllers to generate precise API documentation and improve onboarding for frontend teams.
- Containerized **Java** services using **Docker** and orchestrated build pipelines with **Jenkins** and **GitHub Actions** CI/CD for automated image publishing.
- Provisioned and managed **Kubernetes** clusters using **Terraform**, enabling Infrastructure as Code automation for consistent and repeatable environment setup.
- Introduced **Splunk** logging pipelines for centralized log management and performance visualization across backend and frontend layers.
- Linked **Jenkins** build results and **CI/CD** status directly to **Jira** tasks for automated release tracking.
- Conducted **JMeter** load tests to evaluate API response under concurrent load and fine-tuned **thread pools** for **Spring Boot** performance.
- Introduced **feature toggles** for experimental feature rollout and rollback during production deployments.
- Participated in **Agile** ceremonies to coordinate release priorities with QA, product, and DevOps teams for sprint delivery.

Technological Environment:

Java 11, Spring Boot, RESTful APIs, API Gateway, Microservices, Kafka, PostgreSQL, DynamoDB, SQL, NoSQL, Redis, Angular 14, TypeScript, RxJS, Lazy Loading, Material UI, AWS ECS, CloudWatch, IAM, EC2, Swagger, Kubernetes, Terraform, Docker, GitHub Actions, Jenkins, CI/CD, JUnit, Mockito, Splunk, JMeter, Jira, Agile, Feature Toggles, DTO Mapping

Project: Invoice Management System

A comprehensive **invoice tracking system** was created using **Spring MVC** and **Angular 10** to manage vendor and employee billing. The application exchanged data through **SOAP** and **REST APIs** to connect legacy and modern systems effectively. Developed DAO layers, reactive form components, and optimized MySQL queries to strengthen data accuracy and reporting consistency.

Responsibilities:

- Developed backend modules using **Java 8** and **Spring MVC** for managing employee and invoice transactions within enterprise business workflows.
- Created **Angular 10** reactive forms using **TypeScript** to validate data inputs and simplify reporting modules for legacy dashboards.
- Built **SOAP services** with WSDL definitions and schema validation using **XML** to exchange structured data with third-party vendor systems.
- Designed **XML transformations** using XSLT for flexible message conversion between internal services and external API consumers.
- Introduced **RESTful APIs** in **Spring Boot** to modernize existing SOAP endpoints and transition to lightweight JSON communication.
- Configured **Swagger** with Spring MVC controllers to allow developers and QA to test endpoints directly within browser sessions.
- Configured MVC controllers and JSP templates with JSTL to maintain consistent view rendering across mixed technology stacks.
- Optimized **SQL** queries in **MySQL** and stored procedures in **Oracle** to improve reporting efficiency and database performance.
- Managed **MongoDB** collections as **NoSQL** log storage for system traceability and audit management in distributed environments.
- Implemented dynamic page rendering with **JavaScript** and **jQuery AJAX** to handle asynchronous form updates in internal applications.
- Wrote **JUnit** and **Mockito** unit tests for DAO and controller layers to validate XML parsing accuracy and transaction integrity.
- Configured **Jenkins** pipelines for **CI/CD** automation to deploy **WAR files** on **Tomcat** servers across QA and production.
- Managed **Log4J** configurations and monitored runtime errors through **Splunk dashboards** to diagnose exceptions during production support.
- Wrote Linux shell scripts to deploy artifacts, restart services, and validate configurations after system maintenance.
- Used **Jira** automation rules to streamline ticket transitions and send notifications on build completions or deployment updates.

Technological Environment:

Java 8, Spring MVC, Spring Boot, JSP, Struts, SOAP Web Services, XML, XSLT, RESTful APIs, Swagger, MySQL, Oracle, MongoDB, SQL, NoSQL, Angular 10, TypeScript, JavaScript, jQuery, HTML, CSS, Log4J, Splunk, Jenkins, CI/CD, Tomcat, WAR Deployment, Linux, Reactive Forms, MVC Architecture

Education

Master's In Information Technology
Atlantis University

Bachelors in Information Management
Tribhuvan University
