WORK HISTORY

Java Software Engineer at

02/2024 - (0 months)

- Designed Angular 16 modules with lazy loading and implemented TypeScript interceptors and JavaScript utilities to renew tokens, handle session expiry, and redirect failures to improve frontend session reliability.
- Developed Java microservices for order and reporting flows with DTO mapping to validate request payloads for consistent RESTful APIs
- Configured Kafka topics with schema validation, retry logic, and offset handling while building monitoring dashboards to track consumer lag and message throughput.
- Implemented Kafka Dead Letter Queues (DLQ) with automated replay logic to recover unprocessed events without data loss.
- Implemented Resilience4j circuit breakers with fallback logic and retries for transient errors to maintain microservice continuity without workflow interruptions.
- Created MySQL database entities to support configuration modules across distributed applications.
- Designed MongoDB integrations for payload logging and used Amazon RDS for relational storage to reduce production maintenance overhead
- Built Angular dashboards with Material UI forms and developed TypeScript services and JavaScript event handlers for live filtering, DOM updates, and auto-save to update reporting data interactively.
- Automated CI/CD pipelines to containerize Spring Boot services with Docker and deployed them into ECS clusters using blue-green deployment for zero-downtime upgrades.
- Built Python automation scripts for data transformation jobs and integrated Python-based utilities into pipelines for preprocessing tasks before ingestion into ECS workloads.
- Created AWS Lambda functions using Python triggered by S3 events for asynchronous workflows and provisioned EC2 instances with IAM roles to run compute-heavy jobs securely.
- Wrote JUnit and Mockito tests for services and controllers to validate API contracts and used TestContainers to replicate PostgreSQL schemas during integration testing.
- Extended test coverage with JUnit domain tests, applied Mockito for dependency isolation, and used JMeter to validate concurrency during peak transaction traffic
- Implemented asynchronous WebClient calls to external services so that high-volume reporting pipelines processed data without blocking transaction workflows.
- Secured APIs by applying Spring Security filters with OAuth2 and JWT and configured RBAC policies with custom authentication filters to protect sensitive endpoints.
- Deployed infrastructure with CloudFormation templates and configured Kubernetes ConfigMaps for scalable microservices with service discovery and load balancing.
- Integrated SonarQube code analysis into Jenkins pipelines to enforce code quality gates, detect vulnerabilities across different modules.
- Configured Jasmine and Karma test execution in Jenkins pipelines to run automatically in each CI/CD cycle so that frontend quality checks were always part of deployments.
- Monitored workloads using Splunk dashboards and OpenTelemetry traces and configured CloudWatch alarms to detect ECS memory thresholds

- before performance degraded.
- ● Provided on-call support on Linux servers to tail logs, restart services, troubleshoot production issues, and scheduled cron jobs for automated data cleanup.
- ● Executed controlled rollbacks and hotfixes by analyzing Kafka event flows and replayed missed offsets to recover pipelines without duplicate processing
- ● Contributed in Agile Scrum sprints by refining backlog items, estimating stories, and collaborating during planning and reviews to maintain effective communication with QA.

Java Software Engineer at

01/2022 - 01/2024 (2 years)

Java Developer at

11/2019 - 12/2021 (2 years)

EDUCATION

Washington University of Science and Technology

Graduated 2025

- Master's Degree in Information Technology
