WORK HISTORY

Sr. Java Full Stack Developer at Bofa

June 2024 - Present (1.5 Years)

- Delivered end-to-end full-stack development at Fidelity Investments using Spring Boot, Hibernate ORM, Spring Data JPA, JDBC on the backend, and Angular 11/12/13, TypeScript, JavaScript, Bootstrap, HTML5, CSS3, and SASS on the frontend, ensuring dynamic and responsive UI/UX. Engineered Spring Boot-based microservices integrating Hibernate ORM, JPA, and JDBC, exposing RESTful and SOAP APIs to support financial and banking applications. Implemented JMS/Kafka queues for asynchronous and scalable transaction processing. Architected RESTful and gRPC-based microservices with contract-first API design leveraging OpenAPI/Swagger specifications. Integrated Google Workspace APIs (Sheets, Drive, and Gmail) into enterprise reporting tools for data-driven automation. Maintained database versioning and schema migrations with Liquibase, ensuring seamless cross-environment deployments. Expanded CI/CD pipelines to include automated integration tests, improving deployment confidence and reducing release regressions by 20%. Developed ETL pipelines and big data workflows using Airflow, Kafka Streams, and AWS Glue, optimizing data transfer to Snowflake and BigQuery. Built SaaS components supporting multi-tenant reporting using Tableau and Grafana dashboards. Architected Spring Boot microservices with data-centric APIs integrated across cloud environments (AWS, GCP). Leveraged Alteryx and Ab Initio for enterprise data transformation and operational reporting. Developed event-driven microservices leveraging Apache Kafka, RabbitMQ, and IBM MQ, enabling asynchronous event-based communication across distributed systems. Implemented backend business logic using Spring Boot, integrating caching mechanisms (Ehcache, Redis) and transaction management for high-throughput financial operations. Designed and maintained data access layers with Hibernate ORM and Spring Data JPA, creating optimized queries, batch processing routines, and stored procedures for Oracle, MySQL, PostgreSQL, and MongoDB. Authored Bash and Python scripts to automate system administration tasks, streamline deployment, and optimize cloud resource management within Linux environments. Deployed and managed applications on AWS (EC2, ECS, RDS, DynamoDB), implementing Docker and Kubernetes for container orchestration, while integrating GitLab CI/CD, Jenkins, and Maven/Gradle for automated build and release pipelines. Implemented secure APIs with OAuth 2.0, OIDC, JWT, IAM roles, and leveraged Apigee, AWS API Gateway, and Azure API Management for centralized access control and regulatory compliance. Integrated RESTful APIs and GraphQL into scalable SaaS platforms, ensuring robust multi-tenant support and seamless real-time data exchange between Angular frontends and backend services. Designed real-time ETL pipelines with Kafka Streams, Apache Flink, and Apache Airflow to ingest, transform, and load data into GCP BigQuery for financial reporting and analytics. Managed relational and NoSQL databases, writing optimized SQL queries, stored procedures, and triggers in Oracle, MySQL, PostgreSQL, MongoDB, and CassandraDB, while leveraging Spring Data JPA and Hibernate ORM for seamless persistence. Administered AWS infrastructure including EC2, ECS Fargate, API Gateway, IAM, Security Groups, S3, Lambda, Route 53, CloudWatch, SQS, and CloudFront CDN, ensuring secure, scalable, and high-performance deployments with Kubernetes and Docker. Streamlined CI/CD automation with GitLab CI/CD, Bitbucket Pipelines, Jenkins, GitHub Actions, Helm Charts, Terraform, and Ansible, significantly enhancing Agile SDLC efficiency. Developed Angular SPAs

optimized with lazy loading, Ahead-of-Time compilation (AOT), RxJS observables, and state management patterns. Improved frontend performance by 30% through code splitting, caching strategies, and efficient API interactions. Implemented Spring Security with OAuth 2.0, JWT, LDAP, IAM, and ForgeRock for microservice authentication, enabling secure SSO and role-based access control. Adopted TDD principles and created test cases using JUnit, Mockito, PowerMock, Selenium, Apache JMeter, and Jasmine/Karma for Angular unit and integration testing to achieve high test coverage. Integrated enterprise monitoring and logging with Apache Log4j, AWS CloudWatch, Splunk, and ELK Stack (Elasticsearch, Logstash, Kibana) for proactive debugging and system health monitoring. Optimized backend performance with Java 21 ZGC (Z Garbage Collector), Streams API, Lambda Expressions, JDBC optimizations, database connection pooling, and enhanced query execution efficiency. Worked on backend tools and frameworks including Spring Boot starters, Spring AOP, Spring Batch, Spring Cloud Config, Feign Client, and RestTemplate for robust microservice communication and integration. Actively collaborated in Agile Scrum teams with daily stand-ups, sprint planning, and retrospectives; performed peer code reviews, mentored junior developers, and documented Fidelity microservice architecture patterns in Confluence

EDUCATION

University of North America - Masters Degree

Graduated 2025-01-01

- Computer Science

SKILLS

- HTML, To complete
- Java (Programming Language), To complete
- JavaScript (Programming Language), To complete
- Acceptance Testing, To complete
- API, To complete
- Agile Methodology, To complete
- Artificial Intelligence, To complete
- Amazon Web Services, To complete
- Amazon Elastic Compute Cloud, To complete
- Amazon S3, To complete
- Securitization, To complete
- JIRA, To complete
- Automation, To complete
- Microsoft Azure, To complete
- Big Data, To complete
- Business Efficiency, To complete
- CSS, To complete
- Claim Processing, To complete
- Cloud Computing, To complete
- Program Optimization, To complete
- Profilers, To complete
- Communication, To complete
- Data Processing, To complete

- Databases, To complete
- Continuous Integration, To complete
- Data Retrieval, To complete
- DevOps, To complete
- Web Development, To complete
- Distributed Architectures, To complete
- Fraud Prevention And Detection, To complete
- Hibernate (Java), To complete
- Scalability, To complete
- Problem Solving, To complete
- Java Database Connectivity, To complete
- Java Persistence API, To complete
- Junit, To complete
- Python (Programming Language), To complete
- Unix Shell, To complete
- Load Testing, To complete
- MySQL, To complete
- Performance Tuning, To complete
- Scrum (Software Development), To complete
- Tensorflow, To complete
- Software Engineering, To complete
- SQL Databases, To complete
- Stock Control, To complete
- Streamlines, To complete
- Workflows, To complete
- Scripting, To complete
- Testing, To complete
- Reliability, To complete
- React, To complete
- Spring-boot, To complete
- Git, To complete
- Amazon Relational Database Service, To complete
- Kubernetes, To complete
- Team-working, To complete
- Restful Api, To complete
- Docker, To complete
- Jenkins, To complete
- Microservices, To complete
