

SAI GODAVARTHI

+1 (817) 807-0790 | vinayg0310@gmail.com

SUMMARY

- Software Engineer with 3+ years of experience in designing and developing high-performance backend systems in the banking, finance, and compliance domains.
- Proficient in Java, Spring Boot, Kafka, and MongoDB, with hands-on expertise in building microservice architectures and event-driven systems.
- Skilled in deploying applications on cloud platforms including AWS (EC2, RDS, Lambda) and Azure (App Services, Storage, Key Vault).
- Proven ability to deliver scalable, secure, and fault-tolerant systems for transaction processing, audit logging, regulatory compliance, and real-time analytics.
- Experienced in Agile development environments with active participation in sprint planning, code reviews, and cross-functional collaboration.
- Strong track record of working with distributed global teams, translating complex business and regulatory requirements into reliable engineering solutions.

TECHNICAL SKILLS

- **Programming Languages:** C++, Java, SQL, PL/SQL, JavaScript
- **Frameworks:** Spring Boot, Spring MVC, Spring Security, Hibernate, JPA, Maven, Gradle
- **Web Services:** RESTful APIs, SOAP, Swagger/Open API
- **Testing:** JUnit, Mockito, REST Assured, Postman
- **Databases:** SQL, NoSQL, MongoDB, MySQL, PostgreSQL, Oracle, Microsoft Windows
- **Cloud Platforms:** Azure (App Services, SQL, Key Vault, Storage), AWS (EC2, S3, Lambda, RDS)
- **DevOps Tools:** Jenkins, Git, Docker, Kubernetes (basic), SonarQube, Nexus
- **Frontend:** HTML, CSS, JavaScript, React, Angular, Thymeleaf
- **IDEs/Tools:** IntelliJ IDEA, Eclipse, Visual Studio Code
- **Agile/Tools:** JIRA, Confluence, Bitbucket, IntelliJ IDEA, Eclipse
- **Messaging/Streaming:** Kafka, RabbitMQ (basic)

EXPERIENCE

Tech Robots | Senior Java Developer

Jan 2025 - Present | Cary, NC

- Built a real-time liquidity analytics platform to help treasury teams monitor short-term funding gaps using Spring Boot, MongoDB, and Kafka. Enabled predictive cash flow analysis.
- Designed and deployed microservices to process and transform high-frequency trade and loan data for regulatory reports. Optimized Kafka consumers for performance, handling 1M+ events/day with <100ms processing latency.
- Led migration of a core compliance module to AWS, implementing secure EC2 instances, RDS PostgreSQL databases, and integrating with S3 for report archival.
- Developed automated reconciliation tools to track intra-day transaction mismatches between internal systems and external clearing platforms.
- Refactored legacy code into modular services following domain-driven design, significantly improving team velocity and reducing error-prone deployments.
- Created centralized configuration management using Spring Cloud Config and Vault for secure credential handling across dev, UAT, and prod environments.
- Integrated Prometheus and Grafana dashboards with Kubernetes deployments to provide real-time system health monitoring and alerts for failures.

Cognizant | Senior Java Developer

May 2021 - May 2022 | Chennai, India

- Engineered microservices for a financial rewards and transaction compliance platform, improving integration with mobile banking apps and third-party POS systems.
- Designed and implemented Kafka producers/consumers to enable asynchronous processing of transaction and user data, reducing latency by 30% and increasing throughput.
- Built MongoDB-backed services for flexible data modeling and faster retrieval in real-time financial operations. Reduced response times by ~40% through indexing and aggregation pipeline optimization.
- Developed Spring Security OAuth2-based authentication and fine-grained authorization for internal portals and

third-party APIs.

- Created RESTful APIs using Spring Boot for seamless integration between services and external vendors; documented them using Swagger/OpenAPI.
- Automated deployment pipelines using GitLab CI and Docker for different testing stages (QA/UAT/prod), resulting in 70% faster release cycles.
- Worked closely with QA and DevOps teams to integrate JUnit, Mockito, and REST Assured test suites into CI pipelines, ensuring test coverage >85%.
- Participated in sprint ceremonies, backlog refinement, and production support rotations, enhancing cross-team collaboration.

Cognizant | Java Developer

Jul 2019 - Apr 2021 | Chennai, India

- Contributed to modernization of a legacy banking platform, replacing SOAP services with lightweight REST APIs, simplifying integration for client-facing channels.
- Implemented audit logging microservices to track all user and system actions, storing data in a centralized MongoDB collection and streaming events to Kafka for real-time monitoring and compliance reporting.
- Built scheduled reporting jobs using Spring Batch to generate quarterly financial compliance reports in Excel and PDF format.
- Integrated secure single sign-on (SSO) and role-based access control (RBAC) into the bank's internal compliance tools using Spring Security and custom permission logic.
- Used Hibernate ORM with Oracle/PostgreSQL to persist core banking data, implementing query tuning and caching strategies to improve reporting speed.
- Participated in post-deployment support and root cause analysis of production issues, helping reduce mean time to recovery (MTTR) by 40%.
- Collaborated with business analysts to gather requirements for regulatory workflows and ensured delivery matched changing compliance regulations.

ACADEMIC PROJECTS

Real-Time Stock Analytics API Using Kafka & Spring Boot

- Built a stock monitoring system using Kafka consumers and producers to stream data in real time.
- Integrated MongoDB for storage and exposed WebSocket & REST endpoints using Spring Boot.
- Enabled push-based real-time dashboards for tracking stock trends with low latency.

Movie Recommendation System (Java + Microservices + ML)

- Developed a Spring Boot backend that interacted with a Python-based ML service for movie recommendations.
- Managed user authentication, preferences, and rating storage using MySQL and Hibernate.
- Exposed recommendation APIs for integration with a web interface.

YouTube Comment Analysis and Summarization using LLM

- Developed a web application using Flask to extract, analyze, and summarize YouTube comments and transcripts, utilizing YouTube APIs for real-time data collection.
- Applied NLP techniques like tokenization, sentiment analysis, and Exploratory Data Analysis (EDA) to uncover insights and patterns.

EDUCATION

The University of Texas at Arlington

Master of Science, Data Science (3.80 CGPA) | Jan 2023 - Dec 2024

- **Coursework:** Enterprise Application Development, Software Design and Architecture, Data Structures and Algorithms, Big Data Technologies, Database Systems, Machine Learning for Engineers, Cloud Computing, Statistical Methods for Data Science
