

Sahithi Gangaram

Dallas, TX | 469-426-8875 | gangaramsahithi@alumni.emory.edu | [LinkedIn](#) | [GitHub](#)

Summary

Early career data analyst focused on clinical and operational datasets. Builds reproducible pipelines, performs rigorous QC, and translates findings for nontechnical stakeholders to support study integrity and reporting.

Education

Emory University

Aug 2024

Bachelor of Science, Quantitative Sciences (Biological Anthropology)

Baylor University

Aug 2025 - 2026

Masters of Science in Medical Sciences

Core Competencies

- **Core Competencies:** Data quality checks & audit trails, Codebook/data dictionaries, Longitudinal & timeseries analysis (R, Python, SQL), Database Management, Healthcare Analytics, Report Preparation
- **Technical Skills:** Python, R, R Shiny, ggplot2, matplotlib, SQL, Tableau, Excel, Git

Internships & Experience

Emory University – Oxford Research Scholars Program | Sports Analytics

May 2021 - Dec 2021

10-week funded research project analyzing racial bias in officiating within the Women's Flat Track Derby Association (WFTDA), utilizing data analysis tools to scrutinize 422 skaters across multiple seasons

- Analyzed racial bias in officiating within the Women's Flat Track Derby Association by processing 655 skater images and game data in SQL and R; applied LOESS regression to evaluate penalty rates by skin tone and race.
- Conducted sensitivity analysis, validating statistical differences (0.173 for White skaters vs 0.164 for non-White skaters) and recommending policy adjustments to reduce bias.
- Presented findings at multiple symposiums (UConn Sports Analytics Symposium, Georgia Undergraduate Research Conference, Oxford Research Scholars Symposium), translating complex statistical results into actionable strategies for league officials and diversity advocates.

Julia's Center for Healthcare | Volunteer Healthcare Data Analyst

Mar 2019 - Present

Performed exploratory data analysis on 314 patient records to identify patterns and correlations in A1C, blood pressure, BMI, and LDL cholesterol, supporting data-driven clinical decision-making.

- Flagged 43 critical high A1C cases (13.7%) and 144 pre-diabetic cases (45.8%), enabling targeted outreach and early intervention programs.
- Detected 61 patients (46.5%) with worsening hypertension; collaborated with clinicians to translate findings into evidence-based treatment adjustments.
- Designed Excel and R Shiny dashboards to track follow-up compliance, increasing patient follow-ups by 15% and improving coordination between administrative and clinical teams.

Grand Prairie Urgent Care | Healthcare Data Analyst

Jun 2024 - Present

Analyzed 1,200+ patient records from the Aprima EHR system to identify visit frequency, chronic condition trends, and provider workload patterns, collaborating with interdisciplinary stakeholders to translate findings into actionable recommendations for care optimization.

- Built Excel-based pivot tables and dashboards integrating predictive models to compare outcomes across six providers, helping identify care gaps and high-risk patient groups.
- Summarized insights from three years of clinic operations data into monthly leadership reports that informed staffing adjustments, service expansion decisions, and patient outreach strategies.
- Managed weekly CRM reporting to create 25–30 targeted outreach lists, streamlining task assignments and enhancing communication across administrative and clinical teams.

Technical Projects

Disparities in Diabetes-Related Mortality Among Asian Americans | Stanford Center for Asian Health Research and Education (CARE)

Apr 2024 - Present

- Developed Cox proportional hazards models in R to evaluate racial disparities in diabetes-related mortality among Asian American subgroups (Asian Indian, Chinese, Filipino) compared to Non-Hispanic Whites.
- Conducted longitudinal data analysis to examine trends in diabetes prevalence, mortality risk factors, and the role of socioeconomic determinants in survival outcomes.
- Integrated NHIS and NVSS datasets to calculate age-standardized mortality rates (ASMR) and estimate hazard ratios for all-cause mortality among diabetic and non-diabetic individuals.
- Findings presented at the American Heart Association (AHA) Epidemiology & Lifestyle Scientific Sessions (March 2025, New Orleans).

Hair Cortisol & Parental Chronic Stress Research | Stanford CARE

Apr 2024 - Present

- Analyzed hair cortisol (HCC) and oxytocin (HOC) levels in 547 Bay Area parents, examining associations between biomarkers, parental stress, and demographic variables (race, gender, socioeconomic status, work hours).
- Built logistic regression models to predict high parental stress levels based on biomarkers and demographic data.
- Conducted likelihood ratio tests (LRT) to compare model performance, demonstrating a significant cortisol-gender interaction ($\chi^2=5.01$, $p=0.03$).
- Identified gender-specific oxytocin-stress interactions ($p=0.0287$), offering novel insights into physiological stress mechanisms.
