PROFESSIONAL EXPERIENCE

APPLE INC

Java Full Stack Developer – Austin, TX

April 2025 – Present

- Engineered backend services for the Trade-In module in Apple's online store using Spring Boot and microservices, supporting trade-in operations for hero products like iPhone and MacBook, impacting millions of transactions annually.
- Implemented centralized configuration management via Apple's plist engine, reducing configuration update time by 40% and ensuring consistency across all iOS service integrations.
- Developed geo-specific configuration-driven routing that dynamically directed API calls based on product and region-specific settings enabling loosely coupled, reusable backend logic and improving maintainability across global deployments.
- Designed and integrated a configuration-driven content architecture using Apple's internal AEM tool (Nemo), eliminating hard-coded UI elements and enabling content teams to make updates without developer involvement, improving release speed by 30%.
- Improved application performance and scalability by delivering dynamic, decoupled UI content from Nemo, ensuring high availability and reduced downtime during content changes.
- Partnered with cross-functional design, QA, and infrastructure teams to deliver backend enhancements aligned with Apple's global UX standards, contributing to faster feature rollout cycles.

USAA

Java Full Stack Developer – San Antonio, TX

October 2024 – March 2025

- Involved in design and development of migrating a legacy framework to a microservices architecture to improve scalability, modularity, and performance.
- Implementing the API layer by following the Java Reactive programming practices.
- Implementing a data transformation API layer to accommodate legacy application to Generic UI framework.
- Expertise in configuring AWS EKS Spring Boot Application, Docker file configurations.
- Developed containerized microservices using Docker and deployed them to AWS Elastic Kubernetes Service (EKS) platform to enhance application availability and resilience.
- Integrating the Data dog to monitor and capture the application metrics like request volumes, Error Rate, Latency, Rate Limiting.
- Proposed a solution to capture custom error details using event-based mechanism to enable method-level alerts using Datadog Instrumentation for proactive monitoring and troubleshooting.
- Proposed and working on solutions to organize configuration data in a centralized storage using AWS App Config and AWS Parameter Store.
- Working with multiple teams to ensure seamless integration of all components using APIs across backend and UI layer.
- Maintaining documentation for implemented solutions.

Reprise Financials

Java Full Stack Developer

August 2023 – September 2024

- Developed new components of application in Java and following spring boot microservices and agile practices.
- Implemented RESTful APIs and web services using Spring MVC annotations and knowledge of request handling, data binding and validation mechanisms provided by spring framework.
- Utilized data structures in Java lists, maps, trees, and graphs, along with algorithms for sorting, searching, and optimization, to process and analyze large volumes of data effectively.
- Employed Java Design patterns like Singleton, Factory and builder patterns to ensure efficient object creation, maintainability, and enhanced code readability.
- Monitored system performance and resource utilization, making necessary adjustments to optimize the runtime environment for Java applications.

- Good Command on SQL query writing skills for data retrieval and manipulation using different SQL clauses like JOIN, GROUP BY, HAVING, SELECT and other clauses effectively.
- Proficiency in integrating Spring Data JPA for database access and management in Spring Boot applications and understanding of JWT for securing APIs in Spring Boot applications.
- Implemented Jenkins CI/CD pipeline for automated testing and deployment, reducing deployment time by 50%.
- Strengthened data security with encryption and tokenization techniques, by implementing secure authentication and authorization using JWT with Spring Security integration.
- Developed Scheduler with cron expression to automate multiple file commit and push functionality to git through git GraphQL API.
- Fixed production bugs by analyzing logs on AWS EC2 instances, making necessary code changes for Java based applications, and performing data manipulation in Oracle database while ensuring minimal processing time.

Jocata | EVOKE

Java Developer

January 2020 - December 2021

- Evoke is verification platform to verify the customer information, this product has stack of APIs used by clients to verify information through customizable interface and ready to deploy APIs
- Developed a bulk request process service using Spring Batch scheduler job, which reads the data from excel cells, form Json requests for APIs in EVOKE and trigger's requests in a bulk and writes the response to database and generates the excel with response.
- Formulated a generic wrapper service in Java for the product to consume the data from all microservices and persist to relation database MySQL.
- Employed Singleton pattern to ensure that only one instance of critical components, such as credit scoring service, existed throughout the application, ensuring consistency and resource efficiency.
- Used OAuth 2.0 authentication protocol for secure authentication and authorization, Swagger UI for Java Based application to fetch Rest API documentation.
- verified the Java based microservices health checks through SpringBoot admin console.
- Ability to backtrack the issue efficiently and provide the optimal solution, deploy and maintain the application into Dev, UAT and Prod environments.
- Automated the application deployment based on the environment by developing the Jenkins pipeline using Groovy.
- Collaborated with cross functional teams for application deployments, URL whitelisting, and also to integrate AI model API that takes captcha image as input and produce the string as output in response.

Jocata | BOB FINANCIALS

Java Developer

September 2018 – December 2019

- Bob financials is a credit card organization system designed to facilitate both digital and manual credit card application process. The system has automated underwriting incorporated policies that are configured to check for card approval.
- Developed different Rest APIs to accommodate different phases of application, created and optimized the views in relational database to fetch the required data and reduce the processing time of application.
- Worked with the workflow architecture team for the end-to-end workflow design of application and also formulated required code level changes.
- Utilized multithreading to parallelize time-consuming tasks such as credit score validation, income verification, and risk assessment, significantly reducing the overall processing time.
- Developed a multithreaded task executor using Java's Executor Service and ThreadPoolExecutor, allowing the application to process multiple loan applications concurrently while maximizing resource utilization.
- Integrated Camunda workflows with core banking system and payment gateways using Java, ensuring seamless data flow and process automation.
- Developed custom Java delegates and service tasks in Camunda to execute business logic and integrate with external APIs for real-time data processing.
- Designed and implemented complex BPMN workflows using Camunda for various financial processes, including Credit Card approvals, transaction processing, and compliance checks.
- Implemented KAFKA based messaging services for the application.
- Automated the application build and deploy functionality by building CI/CD pipeline script using Groovy in Jenkins.
- Strong Knowledge on Relational and Non-Relational databases like Oracle, SQL Server, MySQL and MongoDB.
- Added service discovery so that available instances get registered and discovered.

EDUCATION

Texas A&M University

Corpus Christi, TX

Jan 2022 – May 2023

- **Master's in computer science, GPA: 3.66**
- **Coursework:** Design and Analysis of Algorithms, Advance Operating Systems, Machine Learning, Database Management Systems, Advance Software Engineering, Deep Learning.

Joginpally B.R. Engineering College

Moinabad, India

June 2013 – May 2017

- **Bachelor of Technology in Computer Science**
- **Coursework:** Java, C language, Data Structures, DBMS, Principal Of Programming Languages, Compiler Design, Linux Programming.

TECHNICAL SKILL SET

Java | J2EE | SpringBoot | SpringMVC | Microservices | HTML | CSS | JavaScript | Angular | JSON | Maven | MySQL | Oracle | MongoDB | Service Discovery | API Gateway | Hibernate | JPA | GIT | Jenkins | Docker | AWS | Rest-API | Tomcat | web Sphere | Junit | Mockito | JMeter | Unix/Linux | Bash | IntelliJ | STS | Eclipse | VS code | Sublime text | Swagger | Confluence | JIRA | Rally.

ADDITIONAL EXPERIENCE AND RECOGNITIONS

- Recognized as a best performed of the Quarter for Year 2021
- Worked as a programmer lab assistant during master's under professor
