

SUMMARY:

C#, Python and SQL Developer with 2 years of work experience. Proficient in AWS Cloud Computing Solutions. Pursuing Master's in Artificial Intelligence and Business Analytics with a focus on leveraging data for strategic decisions. Experience in automating business processes in the field of Finance, Insurance and Sales and Operations.

EDUCATION:

University of South Florida, Tampa FL

Master of Science, Business Analytics and Information Systems

Expected Graduation: May 2025 3.8 CGPA

Relevant Coursework: Data Mining (Python), Quantitative Methods for Business (R Studio), Data Science Programming (Python), Statistical Data Mining (R Studio), Advanced System Design and Analysis, Distributed Information Systems, Big Data for Business, Text Analytics

Manipal Institute of Technology, Manipal, India

May 2021

Bachelor of Engineering, Electronics and Communication (Specialization in Computing)

RELEVANT EXPERIENCE

Teaching Assistant for the Citizen Data Science Program at USF

Feb 2024- Present

- Combined technical expertise with mentorship to enhance student engagement and learning.
- Worked extensively with Python to streamline processes in managing student records and ensuring data integrity.
- This included scripting solutions to:
 - Automate the insertion of student data from Excel files into a SQL database.
 - Create a system to identify students with three valid submissions across distinct courses, enabling the automated generation of certificates.
 - Build scripts to detect and resolve duplicate video URLs in the database.
 - Implement a bulk email dispatch system to efficiently communicate with students.
 - Beyond coding, helped students with tableau projects in classes such as Finance, Risk Management, Management, and Marketing.
 - Role was a blend of technical problem-solving, mentorship, and fostering a deeper understanding of data-driven projects

Software Developer at Accenture (Bangalore India)

May 2021- May 2023

- Developed an online registration system using the ASP.NET Framework, featuring login and signup functionality. Users could view, add, or delete registered courses and track seat availability, with courses automatically marked unavailable when seats were fully booked. The application was successfully deployed on Accenture's internal server
- Developed and deployed a bot using Automation Anywhere, integrated with Python packages, in the production environment to automate the creation of 1 lakh sales and acquisition forms within 48 hours. This automation replaced a manual process that would have required a team of 5 people working for a week each. The bot's efficiency and effectiveness earned client appreciation.
- Received the sparkling star award.

Intern at Bizz4Solutions (Pune India)

May 2018- August 2018

Implemented the space repetition algorithm in python and used the test stores of 1000 students to identify the time interval required by a student before revision, for a particular topic based on the test score of the student in that topic.

PROJECTS (During Master's Program)

Predicting the success of bank telemarketing using data modelling

- Analyzed about 45,000 instances of client data to predict if a client would subscribe to a term deposit
- Cleaned and pre-processed the data, encoded the categorical variables, kept 80 percent data for training and 20 percent for testing
- Used the following models on the data, XGBoost, SVM, Random Forest, Neural Networks, Logistic Regression, and Decision Tree
- Used recall as the metric of choice to determine the best performing model
- Used hyperparameter tuning to improve the results of the model
- Logistic Regression gave the highest recall score of 93 percent

Predicting Rental Price Trends in Different Regions – Data Science Programming

- Analyzed a dataset consisting of past rental prices from 2015-2024, along with the state and county
- Cleaned the dataset, by dropping unnecessary columns, addressing missing values, performing One-Hot-Encoding, and standardizing the values
- Manipulated the data frame using the Pandas and NumPy libraries to make sure that the dataframe (input) could be given to the algorithm
- Used Deep Learning Models like RNN, LSTM and GRU models to predict the rental prices based on the given dataset.

Statistical Analysis on Evolving Patterns of Drug Overdose-Related Mortality Rates- Statistical Data Mining

- Analyzed the average number of drug overdose incidents, by state, in the United States, and the impact of various state policy approaches on addressing the issue of drug overdose.
- Prepared and cleaned the data for analysis using various sources and government websites.
- Used various statistical model to analyze the marginal effects of the various drug control policies on the drug overdose rates

BullFlix Application - Independent study project

- Created a web application using Flask to store movie ratings of users
- Wrote stored procedures in the oracle database such as login, signup and add rating
 - Implemented login, signup and add movie ratings functionality by connecting the flask application with these stored procedures.

Weather Dashboard using MVC Framework

Developed a dynamic web application using the ASP.NET MVC framework to visualize real-time and historical weather data. The application leverages WeatherAPI.com to fetch data and displays interactive charts using Chart.js. Deployed the solution on Azure for global accessibility.

Technologies and Tools

Backend: ASP.NET MVC, C#.

Frontend: HTML, CSS, Bootstrap, Chart.js (via CDN).

API Integration: WeatherAPI.com

Deployment: Microsoft Azure Cloud Services.

Determining Bias and Frames in News Headlines

- Project Scope: Analyzed potential biases and framing in newspaper article headlines related to immigration using the Media Frame Corpus, a dataset containing 11,900 manually annotated news articles.
- Fine-tuned **BERT** with **Focal Loss**, achieving a **micro-accuracy of 59%**, and compared its performance with other models, including **Multi-Classifer**, **Bi-LSTM w/Attention**, and **GPT-3.5**, to evaluate effectiveness in frame prediction
- Used out-of-sample data from **The New York Times** to assess bias distribution during significant immigration policy changes in 2017

- Suggested applications for **reputation management**, **market research**, and **policy advocacy**, emphasizing the impact of framing on public perception and decision-making.

Technologies:

Python, TensorFlow, Scikit-learn, NLTK, Hugging Face Transformers, LexisNexis for data collection.

Financial Database System

- Designed and implemented a Financial System database utilizing a 3-node PostgreSQL cluster architecture, orchestrated through Docker for seamless containerization and deployment. The architecture incorporated sharding and hash partitioning to distribute data across nodes, ensuring scalability, fault tolerance, and optimized query performance.
- Integrated Cassandra's query-first approach to handle distributed data efficiently, prioritizing denormalization and scalability for high-throughput operations like customer account management, loan processing, and transactional queries. Performance benchmarks revealed the strengths of both PostgreSQL for structured data and Cassandra for handling large-scale distributed queries with minimal latency.
- The project emphasized advanced database design principles, including:
 - Deploying Dockerized PostgreSQL nodes for easy scalability and consistent environments.
 - Implementing PostgreSQL foreign data wrappers to enable cross-node data querying.
 - Designing Cassandra schema tailored to query patterns, enhancing read and write efficiency.
 - Conducting detailed performance evaluations to identify trade-offs and propose optimizations, such as indexing, compaction strategies, and connection pooling

Technologies:

Cassandra · Docker

TECHNICAL SKILLS

Framework : Django, Flask, Entity Framework, Spring Boot
Languages : Java, Python, C++, PL/SQL, SQL
Databases : Oracle, SQL
Tools : UiPath, Automation Anywhere, Tableau
