Summary

Data analyst with strong SQL (joins, window functions, CTEs), Python, Excel (VLOOKUP, Pivot Tables, Conditional Formatting), and dashboarding (Tableau/Power BI). Experienced in cleaning and validating datasets, building KPI dashboards, and communicating insights to non-technical stakeholders. Master's in Information Systems (GMU, May 2025). Seeking analyst/BI data roles where I can turn raw data into clear, decision-ready stories.

Projects & Experience

DC Metro Ridership Dashboard [\(Link\)](#)

Feb 2025

- Built an interactive dashboard to visualize DC Metro ridership trends (2019–2024) with filters by year, month, and transit mode.
- Enabled toggling between Bus, Rail, and Grand Total using Dash checklist components.
- Designed time-series plots with tooltips and event markers (COVID-19 lockdown, U.S. election) for context.
- Developed a dynamic insights table to highlight busiest and quietest ridership days by mode/period.
- Performed EDA and data cleaning (null handling, outlier checks); validated aggregates against source totals.
- Documented data definitions and dashboard usage for stakeholders; versioned updates with Git.

Global CO₂ Emissions Visualization (Tableau) [\(Link\)](#)

Jan 2025

- Designed Tableau dashboards analyzing CO₂ emissions by country, year, and per-capita.
- Created comparative visuals of top 10 emitting nations with population vs. emissions scatterplots.
- Built interactive timelines showing shifts in global CO₂ shares from 1750 to 2021.
- Enhanced readability with KPI cards, filters, and dynamic legends.
- Cleaned and merged raw datasets (population, emissions, region codes) to support the dashboard.

Fortune 500 Insights: A Data-Driven Exploration [\(Link\)](#)

Aug 2024

- Analyzed 8 years of Fortune 500 data (1000+ companies) using SQL to uncover trends in sector growth, revenue surges, and HQ shifts.
- Built Tableau dashboards highlighting revenue and profit patterns across U.S. states (e.g., 179% growth in healthcare).
- Identified top cities for tech profitability (Cupertino, Redmond) via SQL filters and window functions.
- Delivered interactive state-level views with filters, tooltips, and maps for exploration.
- Wrote reusable SQL (CTEs, window functions) for YoY growth, ranking, and percentile thresholds; optimized with indexes where applicable.
- Prepared a short insight brief summarizing key KPIs and recommendations for non-technical readers.

Cardiovascular Disease Risk Analysis [\(Link\)](#)

Nov 2023

- Analyzed U.S. cardiovascular disease trends using NHIS data, focusing on age, gender, region, and lifestyle risk factors.
- Used R and Python to create heatmaps, bar plots, and pie charts highlighting high-risk groups.
- Ran advanced SQL queries in MySQL to compare prevalence across regions.
- Engineered features (age bands, risk indicators) and validated distributions; handled missingness and class imbalance checks.
- Communicated findings with clear visuals and a short write-up; published results on personal site.

Education

George Mason University — Fairfax, VA

May 2025

M.S. in Information Systems

Relevant Coursework: Database Systems; Analytics: Big Data to Info; Information Representation, Processing & Visualization; Visualization & Data Analytics; UI Design/Development; IS Analysis/Design

Skills

Programming & Data Analysis: Python, R, SQL; pandas, NumPy; Excel (VLOOKUP, Pivot Tables, Conditional Formatting)

Visualization & BI Tools: Tableau, Power BI; Matplotlib, Seaborn, Plotly, Dash; data storytelling

Databases & Cloud: MySQL, PostgreSQL, SQLite; AWS (S3, EC2, RDS); basic ETL orchestration

Workflow & Collaboration: Git/GitHub, Jupyter, VS Code; documentation, KPIs/metrics, stakeholder communication
