

Tarangini Unnava

Data Engineer

Malden, MA | +1 (220) 221 2187 | taranginiunnava5@gmail.com | [LinkedIn](#)

SUMMARY

Data Engineer specializing in ETL development, data transformation, pipeline scaling & job orchestration across enterprise systems. 5+ years of experience designing automated data workflows using IBM DataStage, SQL, Control-M, and Azure, improving data reliability, refresh cycles, and delivery performance. Strong in data modeling, job optimization, incremental loads, data quality checks, DWH support, and dashboard enablement for business intelligence. Known for reducing pipeline failures, boosting throughput, and delivering clean, trusted data for decision-making.

Brand Position: *A Data Engineer who owns ETL end-to-end — from ingestion to transformation to delivery*

SKILLS

ETL & Data Integration:IBM DataStage (Designer/Director/Administrator) : ETL Architecture (Staging → Transformation → DWH)Batch & Incremental Loading ,Lookup/Transformer Logic ,Reject/Error Handling FrameworksControl-M Job Scheduling ,Workflow Orchestration ,Audit Logging & Data Reconciliation

Database & Query Engineering : SQL Query Optimization ,Joins, Window Functions, Aggregations ,Stored ProceduresDB2 ,SQL Server ,MySQL ,Performance Tuning ,Query Profiling & Indexing Strategies

Data Engineering Concepts : Data Warehousing ,Fact/Dimension Modeling ,Data Quality ValidationSchema Mapping ,Data Lineage & Metadata Management ,Pipeline Monitoring Incremental Load Frameworks ,High-Volume Processing ,Troubleshooting & RCA

Cloud & Deployment:Azure Storage : IAM Policies ,Resource Provisioning ,Data Security Cloud Migration Exposure ,Access Control ,ETL Execution on Cloud nvironments

Analytics & Reporting : Power BI ,DAX Calculations ,Data Modeling for Reporting Layers KPI Dashboards ,Data Profiling ,Business Metrics Visualization

Programming & Tools:Python (Basics) : Shell/Linux Scripting ,Git & Version Control Excel Advanced ,Automation Scripts ,Log Analysis

EXPERIENCE

Cigna - MA, United States Data Engineer	01/2025 - Present
- Designing and maintaining scalable ETL workflows for healthcare datasets including claims, eligibility, provider and encounter-level information, ensuring smooth integration across operational and analytical systems. - Implementing transformation logic, cleansing rules, data standardization & schema alignment to ensure accuracy and compatibility between ingestion pipelines and reporting models. - Building and enhancing job monitoring dashboards, automated alert triggers, pipeline audits & failure-recovery sequences, resulting in stronger process resilience and reduced downtime. - Supporting batch + incremental load frameworks using optimized partitioning and scheduling controls, improving refresh performance and reducing processing delay for reporting teams. - Automating recurring SQL validation steps, anomaly checks, schema drift detection, NULL analysis and field-level verification — cutting manual quality inspection efforts across cycles. - Performing root-cause analysis on transformation errors, format variations, missing attributes and mapping conflicts, reducing repeated ETL failures and speeding RCA resolution. - Collaborating closely with data modelers, BI developers, cloud architects and reporting consumers to deliver clean, structured, query-ready datasets for dashboards and analytics. - Ensuring healthcare compliance by applying controlled access, PHI-handling policies, pipeline monitoring & consistent transformation logic adhering to regulatory standards.	
IBM India Pvt. Ltd - Bengaluru, India Data Engineer	09/2018 - 02/2023
- Built, automated and optimized enterprise-scale ETL pipelines using IBM DataStage, SQL and staging-to-warehouse patterns, enabling continuous data availability for analytics workloads. - Developed reusable ETL components (lookups, routing logic, exception flow, reject capture, mapping templates) resulting in faster development turnaround and reduced maintenance overhead. - Implemented Control-M orchestrations with job dependencies, restart logic, SLA-driven scheduling & automated notification alerts, improving reliability and reducing manual oversight. - Designed ETL architecture to support staging → cleansing → transformation → fact/dimension warehouse layers, improving traceability, readability and structured data lineage. - Tuned SQL joins, indexing schemes, sorting strategies and parallel execution paths — reducing end-to-end batch processing time and improving warehouse load SLA compliance. - Implemented audit reconciliation, record-level comparison, schema validation, data profiling & anomaly tracking, significantly improving trust and accuracy across downstream users. - Built incremental data load designs to reduce redundancy, system load and cost, leading to consistent performance improvement across daily and weekly ingestion cycles. - Worked closely with BI/reporting teams to build consumption-ready fact tables, aggregation layers & KPI extraction views, accelerating dashboard turnaround and decision visibility. - Created process documentation, knowledge assets and ETL troubleshooting guides used for onboarding, dependency tracking, RCA workflows and engineering continuity.	

EDUCATION

Rivier University - New Hampshire, USA Master of Science in Computer Information Systems	May 2025
Jawaharlal Technological University - Kakinada, India BTech in Computer Science and Engineering	April 2018

CERTIFICATIONS

- Deloitte** - Data Analytics Job Simulation
- IBM** — DB2 SQL Coding (Mainframe Application Programmer)
- IBM** — Java Fundamentals for COBOL Programmers
