

Vasudeva Reddy Bolleddula

Data Analyst

Tampa, FL | (656) 212-2198 | vasudevareddi27@hotmail.com | [LinkedIn](#)

SUMMARY

Data Analyst with 4+ years of experience turning complex data into actionable business insights. Improved category performance by uncovering underperforming products and enabling pricing and promotional adjustments. Enhanced supply chain reliability by building predictive inventory forecasting models that minimized stockouts and improved fulfillment efficiency. Streamlined ETL workflows with Python and SQL, cutting down load times and strengthening reporting accuracy. Delivered interactive Tableau and Power BI dashboards with advanced drill-downs, helping marketing and leadership teams make informed strategic decisions. Applied advanced statistical techniques and machine learning models to refine pricing strategies, optimize demand forecasting, and support cross-functional business alignment.

EDUCATION

Master in Business Analytics and Information Systems | *University of South Florida*

SKILLS

Programming Languages: Python (Pandas, NumPy, scikit-learn), R (tidyverse, clustering, statistical testing), SQL, SAS

Analytics & Visualization Tools: Tableau, Power BI (DAX, Power Query, real-time dashboards), Data Storytelling & Visualization, Reporting Automation (Power BI Copilot, GPT APIs), Looker, Jupyter Notebook, Advanced Excel

Cloud & Databases: AWS (S3, Redshift, Glue, Lambda), Azure, Kafka, Cloud Data Warehousing (Snowflake, BigQuery), AI-driven Forecasting, Generative AI Visualization Tools, SQL (advanced querying, joins, optimization), Google BigQuery, PostgreSQL, MS SQL Server, MySQL, Oracle, MongoDB, Snowflake, Teradata

Data Pipelines & Integration: ETL, Apache Airflow, SSIS, Informatica PowerCenter, AWS Glue, Data Transformation, Data Wrangling, Data Cleaning, Python-based Workflow Automation, Data Validation Frameworks

Statistics & ML: Tensorflow, NLP, A/B Testing, ANOVA, Bayesian Inference, Time Series Analysis, Regression Analysis, Classification Modeling, Hypothesis Testing, Clustering (k-means, hierarchical), Predictive Modeling (Random Forest, XGBoost), Demand Forecasting

Project Tools: Git, Agile/Scrum, Cross-functional Collaboration, Executive Reporting, GitHub, JIRA, Confluence

EXPERIENCE

Data Analyst | *McKinsey & Company*

Feb 2025 – Present

- Identified underperforming product categories by developing SQL-based queries and publishing insights through Tableau dashboards, enabling pricing and promotional adjustments that boosted monthly revenue by 12%.
- Streamlined ETL workflows with Python and SQL, cleaning and restructuring legacy datasets while automating data validation, which reduced data load times by 50% and improved report reliability and accuracy.
- Built predictive inventory forecasting models in Python (Pandas, NumPy, scikit-learn) to anticipate stock shortfalls, minimizing stockouts by 35% and improving overall fulfillment efficiency during peak cycles.
- Designed interactive Tableau dashboards with advanced drill-down features to uncover customer behavior trends, empowering marketing teams to launch targeted campaigns that increased ROI by 20%.
- Translated complex analytical findings into executive-level visual stories and reports, leading to cross-functional business actions that improved category-level performance and strategic alignment.
- Applied advanced statistical techniques (ANOVA, regression, hypothesis testing) using R and Python to evaluate pricing strategies, which resulted in an 8% uplift in average order value and margin optimization.
- Piloted machine learning models (XGBoost, Random Forest) within AI-driven forecasting processes, improving demand estimation accuracy by 15% and laying the groundwork for scaling predictive analytics.

Data Analyst | *Capgemini Technology Services*

Oct 2021 – Nov 2022

- Architected and optimized cloud-based ETL pipelines with AWS Glue, Airflow, and Redshift, automating ingestion from disparate sources and reducing end-to-end data refresh latency from hours to minutes.
- Developed time-series forecasting models in Python, SAS, and Tensorflow to predict seasonal demand, informing procurement strategies, reducing excess inventory costs, and maintaining service levels during fluctuating cycles.
- Leveraged NLP techniques in Python to analyze customer feedback at scale, generating sentiment dashboards in Tableau that influenced product roadmap decisions and improved customer satisfaction scores.
- Designed Looker and Power BI dashboards with real-time refresh capabilities, integrating with Kafka streaming data to track operational KPIs and support instant decision-making by leadership.
- Implemented data validation and quality frameworks in SQL and Python with automated alerts, cutting manual QA checks by 60% and ensuring high-confidence reporting for finance and compliance teams.
- Researched and implemented generative AI-driven visualization and automated reporting tools (e.g., Power BI Copilot, GPT APIs), streamlining repetitive tasks, saving analyst hours, and enhancing team-wide productivity.

- Migrated fragmented customer datasets from multiple sources into a centralized cloud data warehouse (Snowflake/BigQuery), enabling unified cross-functional analysis and reducing report generation time by nearly 40%.
- Designed and deployed interactive, real-time Power BI dashboards using DAX and Power Query, allowing business teams to track churn patterns proactively and driving a measurable 10% reduction in customer attrition.
- Built advanced segmentation models in R leveraging clustering techniques (k-means, hierarchical) to identify high-value customer cohorts, which informed targeted marketing strategies and boosted upsell conversions by 18%.
- Delivered monthly analytical reports and storytelling dashboards to senior leadership, translating raw data into actionable insights that influenced acquisition campaign strategies and optimized marketing spend.
- Conducted end-to-end A/B testing using statistical methods (t-tests, significance testing), generating insights that guided product changes and increased new feature adoption rates by 5%.
- Established robust data governance by creating automated validation and quality checks in SQL/Python, ensuring accuracy and completeness while reducing data discrepancies by 25% across reporting pipelines.
- Collaborated cross-functionally in Agile/Scrum environments, using JIRA to deliver analytics sprints that aligned with executive goals and accelerated adoption of AI-driven forecasting initiatives.
