SKILLS

Oracle Database Administration
Backup and Recovery
Oracle Data Gaurd
Patching, Cloning and Migration
OEM Monitoring & Alert Handling
Performance Tuning & query optimization
Tablespace and User Management
linux
MySQL
Postgresql
cloud administration
Terraform
python
mongodb
Mockito & JUnit

PROFILE

Skilled and detail-oriented Database Administrator with 2 years of experience managing Oracle databases at Wipro, specializing in installation, configuration, performance tuning, backup and recovery, and database security. Proficient in tools such as RMAN, Oracle Data Guard, Oracle Enterprise Manager (OEM).. Known for dependable execution of BAU tasks and proactive issue resolution in production and UAT environments. Quick to adapt to new tools and processes, with a strong focus on system stability, data integrity, and continuous learning to support evolving business needs. Recently completed a Master's degree in Computer Science, strengthening technical knowledge in database systems, data management, and distributed computing. Adept at troubleshooting complex issues, optimizing database performance, and ensuring high availability of mission-critical systems. Seeking to contribute to a forward-thinking organization as a Database Administrator by combining hands-on industry experience with strong academic credentials.

EMPLOYMENT HISTORY

Oracle Database Administrator at Wipro, Chennai, Tamil Nadu, India

August 2021 — July 2023

Served as an Oracle Database Administrator focusing on database management and performance optimization.

- Managed Oracle databases, ensuring high availability and reliability for critical applications.
- Performed routine maintenance and updates to maintain optimal database performance.
- Monitored database performance and implemented tuning strategies to enhance efficiency.
- Executed backup and recovery procedures to safeguard data integrity and availability.
- Collaborated with development teams to support database-related needs and streamline processes.
- Tablespace and User Management.
- Patching, Cloning and Migration.
- Oracle Data Guard (physical & Active Standby)

EDUCATION

Master of Science - MS in Computer Science, University of Central Missouri

August 2023 — May 2025

Recently completed a Master's degree in Computer Science with a GPA of 3.8, where I expanded my technical expertise through coursework and hands-on projects in Java, JUnit, Mockito, MySQL, Python, and Terraform. Strong foundation in both database management and modern software development practices, with a passion for continuous learning and problem-solving.

- **Bachelor's degree in Electronics and Communications Engineering & 8.8, Qis College of Education**

July 2017 — July 2021

★ PROJECTS

◦ REMOVING OF SNOW AND RAIN IN A SINGLE IMAGE USING GUIDED FILTER

Dynamic weather conditions, such as rain and snow, degrade the performance of vision algorithms, which is served for video surveillance and analysis tasks. In this paper, we propose a new rain and snow removal method through using low frequency part of a single image. It is based on a key difference between clear background edges and rain streaks or snowflakes, low frequency part can obviously distinguish the different properties of them. Low frequency part is the non-rain or non-snow component. We modify it as a guidance image, the high frequency part as input image of guided filter, so we get a non-rain or non-snow component of high frequency part and add the low frequency part is the restored image.

◦ IMAGE RESTORATION USING MEDIAN FILTERING TECHNIQUE

Nowadays image is valuable media used to analyze the data within it. At some point image which captured get obscured and noise from the environment this process can reduce the quality of picture. In order to reduce the noise different filters are used in this work. Existing filters can be used to restoring the image, such as Gaussian filter, Average filter, Disk filter, Motion filter and Median filter. To obtain the noised images different types of noises like Salt & Pepper noise, Speckle noise and Poisson noise are used.

◦ Wedding Management System Web Application Development

We propose the development of a comprehensive Wedding Management System web application that aims to streamline and automate various processes involved in planning and managing weddings. This platform will provide a user-friendly interface for couples, event planners, and vendors to collaborate effectively and ensure a seamless wedding experience. Our web application will be built using PHP and hosted on AWS elastic beanstalk, leveraging the power of Amazon RDS with MySQL as the database engine. Security will be a top priority in the development process to safeguard sensitive data and protect against potential threats.

◦ Gym Management System

Gym Management Software is a membership management software which is designed particularly for Gym, Recreation center and Health Club. More specifically, the project focuses on the following general goals of the association/organization: To optimise different sorts of administrative and operational processes, as well as to improve numerous aspects for members. This has member management, booking programs, point-of-sale performance, financing and accounting, concession programs, reports, client input, and personal trainer support. The used web framework is Django and MongoDB as the DB. The web application is developed using Django web framework, which offers high level of stability and reliability; however, the NoSQL database MongoDB is used for more free-form structure of the data storage. There is a Django connector to MongoDB called Djongo that allows for easy interaction with MongoDB to perform operations on the data and retrieve it. Some of the entities held in the database include members, plans, trainers, enrollments, and payments with relations to applicable entities for better structuring and organizing of the data in the database.
